

# Package ‘BoutrosLab.plotting.general’

May 6, 2026

**Version** 7.1.5

**Type** Package

**Title** Functions to Create Publication-Quality Plots

**Maintainer** Paul Boutros <PBoutros@sbsdsccovery.org>

**Depends** R (>= 3.5.0), lattice (>= 0.20-35), latticeExtra (>= 0.6-27),  
cluster (>= 2.0.0), hexbin (>= 1.27.0), grid

**Imports** gridExtra, tools, methods, gtable, e1071, MASS(>= 7.3-29)

**Suggests** Cairo (>= 1.5-1), knitr, testthat (>= 3.0.0)

## Description

Contains several plotting functions such as barplots, scatterplots, heatmaps, as well as functions to combine plots and assist in the creation of these plots. These functions will give users great ease of use and customization options in broad use for biomedical applications, as well as general purpose plotting. Each of the functions also provides valid default settings to make plotting data more efficient and producing high quality plots with standard colour schemes simpler. All functions within this package are capable of producing plots that are of the quality to be presented in scientific publications and journals. P'ng et al.; BPG: Seamless, automated and interactive visualization of scientific data; BMC Bioinformatics 2019 <doi:10.1186/s12859-019-2610-2>.

**License** GPL-2

---

auto.axis	<i>Create ideal labels and values for a given numeric vector (detects log scales)</i>
-----------	---

---

**Description**

Takes a numeric vector and several parameters and outputs an object with values and labels ideal for given data

**Usage**

```
auto.axis(
  x,
  pretty = TRUE,
  log.scaled = NA,
  log.zero = 0.1,
  max.factor = 1,
  min.factor = 1,
  include.origin = TRUE,
  num.labels = 5,
  max.min.log10.diff = 2
)
```

**Arguments**

<code>x</code>	Numeric vector to be scaled
<code>pretty</code>	Parameter flag for if output should be in pretty format
<code>log.scaled</code>	parameter set to determine if scaling is logarithmic or not
<code>log.zero</code>	log 0 starting point
<code>max.factor</code>	maximum factor for y variable
<code>min.factor</code>	minimum factor for y variable
<code>include.origin</code>	flag to include the origin value or not
<code>num.labels</code>	number of labels to output
<code>max.min.log10.diff</code>	the max and min difference for dataset to be determined logarithmic

**Author(s)**

Takafumi N. Yamaguchi

**See Also**

[stripplot](#), [lattice](#) or the Lattice book for an overview of the package.

**Examples**

```
set.seed(223);
simple.data <- data.frame(
  x = sample(1:15, 10),
  y = LETTERS[1:10]
);

auto.axis(simple.data$x)

data2 <- c(1,10,100,1000)

auto.axis(data2)
```

---

CNA

*Copy number aberration (CNA) data from colon cancer patients*

---

**Description**

CNA calls from 30 genes across 58 colon cancer patients. Additional data on the patient samples is found in the patient dataset. The same patient samples are described in the microarray and SNV datasets.

**Usage**

CNA

**Format**

A data frame with 58 columns and 30 rows. The columns indicate the patient sample, and the rows indicate the gene. The contents of the data frame are encoded such that 0 indicates no CNA, -1 indicates a CNA loss, and 1 indicates a CNA gain.

**Author(s)**

Christine P'ng

**Examples**

```
data(CNA);
create.dotmap(
  # filename = tempfile(pattern = 'Using_CNA_dataset', fileext = '.tiff'),
  x = CNA[1:15, 1:15],
  main = 'CNA data',
  xaxis.cex = 0.8,
  yaxis.cex = 0.8,
  xaxis.rot = 90,
  description = 'Dotmap created by BoutrosLab.plotting.general',
  resolution = 50
);
```

---

colour.gradient	<i>Creates a colour gradient</i>
-----------------	----------------------------------

---

**Description**

Creates a sequential palette of colours.

**Usage**

```
colour.gradient(
  colour,
  length
);
```

**Arguments**

colour	A single colour to be used as the center value of the sequence
length	The number of colours to include in the palette

**Author(s)**

Ren Sun & Christine P'ng

**Examples**

```
display.colours(colour.gradient('dodgerblue2', 6));

display.colours(colour.gradient(default.colours(1), 3));
```

---

covariates.grob	<i>Create one or more covariate bars</i>
-----------------	--

---

**Description**

Takes a list of covariate bar annotations and creates a grid graphical object for them

**Usage**

```
covariates.grob(
  covariates,
  ord,
  side = 'right',
  size = 1,
  grid.row = NULL,
  grid.col = NULL,
  grid.border = NULL,
  row.lines = NULL,
  col.lines = NULL,
  reorder.grid.index = FALSE,
  x = 0.5,
  y = 0.5
);
```

**Arguments**

covariates	Any covariate annotation to add to the plot, as a fully formed list.
ord	A vector of integer indices indicating the order of the items in the covariate bars.
side	Intended position of the covariate bar when added as a legend. Allowed positions are “right” and “top”.
size	The size of each covariate bar in units of “lines”.
grid.row	A list of parameters to be passed to <code>gpar</code> specifying the behaviour of row lines in the covariate bars. See Notes for details.
grid.col	A list of parameters to be passed to <code>gpar</code> specifying the behaviour of column lines in the covariate bars.
grid.border	A list of parameters to be passed to <code>gpar</code> specifying the behaviour of the border around the covariate bars.
row.lines	Vector of row indices where grid lines should be drawn. If NULL (default), all row lines are drawn. Ignored if <code>grid.row</code> is not specified.

<code>col.lines</code>	Vector of column indices where grid lines should be drawn. If NULL (default), all column lines are drawn. Ignored if <code>grid.col</code> is not specified.
<code>reorder.grid.index</code>	Boolean specifying whether grid line indices should be re-ordered according to the <code>ord</code> argument. Defaults to FALSE.
<code>x</code>	x coordinate in npc coordinate system
<code>y</code>	y coordinate in npc coordinate system

**Value**

A grid graphical object (grob) representing the covariate bar(s)

**Notes**

This code is an adaptation of the `dendrogramGrob` function in the `latticeExtra` package. It uses functions of the `grid` package.

By default, the covariate bar grid is drawn via borders around individual rectangles using the parameters specified in the `covariates` argument (`col`, `lwd`, etc.). If `grid.row`, `grid.col`, or `grid.border` are specified by the user, additional grid lines are drawn over any existing ones using the parameters in these lists.

disable.factor.sorting = FALSE
);

```

### Arguments

formula	The formula used to extract the x & y components from the data-frame. Transforming data within formula is not compatible with automatic scaling with 'xat' or 'yat'
data	The data-frame to plot
groups	Optional grouping variable. Expression or variable.
stack	Logical, relevant when groups is non-null. If FALSE (the default), bars for different values of the grouping variable are drawn side by side, otherwise they are stacked
filename	Filename for tiff output, or if NULL returns the trellis object itself
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title, defaults to 3
xlab.label	The label for the x-axis
ylab.label	The label for the y-axis
xlab.cex	Size of x-axis label, defaults to 2
ylab.cex	Size of y-axis label, defaults to 2
xlab.col	Colour of the x-axis label, defaults to black

<code>ylab.col</code>	Colour of the y-axis label, defaults to black
<code>xlab.top.label</code>	The label for the top x-axis
<code>xlab.top.cex</code>	Size of top x-axis label
<code>xlab.top.col</code>	Colour of the top x-axis label
<code>xlab.top.just</code>	Justification of the top x-axis label, defaults to centered
<code>xlab.top.x</code>	The x location of the top x-axis label
<code>xlab.top.y</code>	The y location of the top y-axis label
<code>abline.h</code>	Specify the superimposed horizontal line(s)
<code>abline.v</code>	Specify the superimposed vertical line(s)
<code>abline.lty</code>	Specify the superimposed line type
<code>abline.lwd</code>	Specify the superimposed line width
<code>abline.col</code>	Specify the superimposed line colour (defaults to black)
<code>axes.lwd</code>	Specify line width of the axes; set to 0 to turn off axes
<code>add.grid</code>	Specify whether to draw grid or not (defaults to FALSE)
<code>xgrid.at</code>	Specify where to draw x-axis grid lines (defaults to xat)
<code>ygrid.at</code>	Specify where to draw y-axis grid lines (defaults to yat)
<code>grid.lwd</code>	Specify width of grid line (defaults to 5)
<code>grid.col</code>	Specify colour of grid line. Currently only supports one colour. Defaults to NULL, which uses the colour of the reference line.
<code>xaxis.lab</code>	Vector listing x-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with xat will overwrite user input. Set to NULL to remove x-axis labels.
<code>yaxis.lab</code>	Vector listing y-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with yat will overwrite user input. Set to NULL to remove y-axis labels.
<code>xaxis.col</code>	Colour of the x-axis tick labels, defaults to black
<code>yaxis.col</code>	Colour of the y-axis tick labels, defaults to black
<code>xaxis.fontface</code>	Fontface for the x-axis scales
<code>yaxis.fontface</code>	Fontface for the y-axis scales
<code>xaxis.cex</code>	Size of x-axis tick labels, defaults to 1.2
<code>yaxis.cex</code>	Size of y-axis tick labels, defaults to 1.5
<code>xaxis.rot</code>	Rotation of x-axis tick labels; defaults to 0
<code>yaxis.rot</code>	Rotation of y-axis tick labels; defaults to 0
<code>xaxis.tck</code>	Specifies the length of the tick marks for x-axis, defaults to 1
<code>yaxis.tck</code>	Specifies the length of the tick marks for y-axis, defaults to 1
<code>xlimits</code>	Two-element vector giving the x-axis limits. Useful when <code>plot.horizontal = TRUE</code>
<code>ylimits</code>	Two-element vector giving the y-axis limits

<code>xat</code>	Accepts a vector listing where x-axis ticks should be drawn or if automatic scaling is desired, one of three strings: “auto”, “auto.linear” or “auto.log”. Automatic scaling fixes x-axis tick locations, labels, and data values dependent given data. “auto” will determine whether linear or logarithmic scaling fits the given data best, “auto.linear” or “auto.log” will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see ‘auto.axis()’. Useful when <code>plot.horizontal = TRUE</code>
<code>yat</code>	Accepts a vector listing where y-axis ticks should be drawn or if automatic scaling is desired, one of three strings: “auto”, “auto.linear” or “auto.log”. Automatic scaling fixes y-axis tick locations, labels, and data values dependent given data. “auto” will determine whether linear or logarithmic scaling fits the given data best, “auto.linear” or “auto.log” will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see ‘auto.axis()’.
<code>layout</code>	A vector specifying the number of columns, rows (e.g., <code>c(2,1)</code> ). Default is NULL; see <code>lattice::xyplot</code> for more details
<code>.</code>	
<code>as.table</code>	Specifies panel drawing order, default is FALSE which draws panels from bottom left corner, moving right then up. Set to TRUE to draw from top left corner, moving right then down
<code>x.spacing</code>	A number specifying the distance between panels along the x-axis, defaults to 0
<code>y.spacing</code>	A number specifying the distance between panels along the y-axis, defaults to 0
<code>x.relation</code>	Allows x-axis scales to vary if set to “free”, defaults to “same”
<code>y.relation</code>	Allows y-axis scales to vary if set to “free”, defaults to “same”
<code>top.padding</code>	A number specifying the distance to the top margin, defaults to 0.5
<code>bottom.padding</code>	A number specifying the distance to the bottom margin, defaults to 2
<code>right.padding</code>	A number specifying the distance to the right margin, defaults to 1
<code>left.padding</code>	A number specifying the distance to the left margin, defaults to 1
<code>key.bottom</code>	A number specifying how much space should be left for the key at the bottom, defaults to 0.1
<code>ylab.axis.padding</code>	A number specifying the distance of y-axis label to the y-axis, defaults to 0
<code>,</code>	
<code>xlab.axis.padding</code>	A number specifying the distance of x-axis label to the x-axis, defaults to 0.5. Named differently than <code>ylab.axis.padding</code> because these are lattice’s internal names for these values
<code>col</code>	Filling colour of bars, defaults to black, does a grey-scale spectrum if <code>!is.null(groups)</code>
<code>border.col</code>	Specify border colour (defaults to black)
<code>border.lwd</code>	Specify border width (defaults to 1)

plot.horizontal	Plot the bars horizontally. Note if <code>disable.factor.sorting = TRUE</code> , then the top row of data is the bottom row of the plot, i.e. bars are filled in from the bottom to the top of the plot. To make the barplot rows match the input data rows, make sure the y-axis variable is a factor, and do <code>data = data[nrow(data):1,]</code>
background.col	Plot background colour, defaults to transparent
origin	The origin of the plot, generally 0
reference	Should the reference line be printed at the origin
box.ratio	Specifies the width of each bar, defaults to 2
sample.order	Should the bars be reordered, accepts values “increasing”, “decreasing” or a vector of sample names. Labels will also be reordered
group.labels	Should the labels be grouped to the same amount of bars per column
key	A list giving the key (legend). The default suppresses drawing
legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See <code>xyplot</code> .
add.text	Allow additional text to be drawn, default is FALSE
text.labels	Labels for additional text
text.x	The x co-ordinates where additional text should be placed
text.y	The y co-ordinates where additional text should be placed
text.col	The colour of additional text
text.cex	The size of additional text
text.fontface	The fontface for additional text
strip.col	Strip background colour, defaults to white
strip.cex	Strip title character expansion
y.error.up	A vector specifying the length of the error bar going up from each point. If set to NULL (the default), error bars will not be drawn
y.error.down	A vector specifying the length of the error bar going down from each point. By default, it is set to <code>y.error.up</code>
y.error.bar.col	A string or vector of strings specifying the colour of the error bars. Defaults to black
error.whisker.width	A number specifying the width of the error bars. Defaults to a rough approximation based on the size of the data
error.bar.lwd	The line width of the error bars. Defaults to 1
error.whisker.angle	The angle of the error bar whiskers, defaults to 90. Can be changed to produce arrow-like bars
add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x coordinate of the rectangle to be drawn

<code>ybottom.rectangle</code>	Specifies the bottom y coordinate of the rectangle to be drawn
<code>xright.rectangle</code>	Specifies the right x coordinate of the rectangle to be drawn
<code>ytop.rectangle</code>	Specifies the top y coordinate of the rectangle to be drawn
<code>col.rectangle</code>	Specifies the colour to fill the rectangle's area
<code>alpha.rectangle</code>	Specifies the colour bias of the rectangle
<code>line.func</code>	Function for the line that should be drawn on top of plot
<code>line.from</code>	The starting point of the line on the plot
<code>line.to</code>	The ending point of the line on the plot
<code>line.col</code>	Colour of the line on the plot
<code>line.infront</code>	Should the line appear in front of the plot or not
<code>text.above.bars</code>	Should some form of text appear above the bars; input as a list. <code>bar.locations</code> is the x-axis when vertical and y-axis when horizontal. See <code>lattice::ltext</code> arguments for all possible values that can be passed in. ( <code>col</code> , <code>alpha</code> , <code>cex</code> , etc, can all be passed in as a single value or vector of same length as <code>text.above.bars\$labels</code> )
<code>raster</code>	The image to raster over each bar - see Raster Images in R Graphics by Paul Murrell for full details
<code>raster.vert</code>	A logical indicating whether the raster is applied vertically or horizontally
<code>raster.just</code>	A word giving the justification of the raster, can be set to "left", "right", "centre", "center", "bottom", or "top"
<code>raster.width.dim</code>	A unit object giving the width of the raster bar
<code>height</code>	Figure height, defaults to 6 in
<code>width</code>	Figure width, defaults to 6 in
<code>size.units</code>	Figure units, defaults to inches
<code>resolution</code>	Figure resolution, defaults to 1600
<code>enable.warnings</code>	Print warnings if set to TRUE, defaults to FALSE
<code>description</code>	Description of image/plot; default NULL
<code>style</code>	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
<code>preload.default</code>	ability to set multiple sets of different defaults depending on publication needs
<code>use.legacy.settings</code>	boolean to set whether or not to use legacy mode settings (font)
<code>inside.legend.auto</code>	boolean specifying whether or not to use the automatic inside legend function
<code>disable.factor.sorting</code>	Disable barplot auto sorting factors alphabetically/numerically

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

```

### Arguments

formula	The formula used to extract the x & y components from the data-frame. Transforming data within formula is not compatible with automatic scaling with 'xat' or 'yat'.
data	The data-frame to plot
filename	Filename for tiff output, or if NULL returns the trellis object itself
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title, defaults to 3
add.stripplot	logical whether to plot all points, defaults to FALSE
jitter.factor	Numeric value to apply to jitter, default is 1
jitter.amount	Numeric; amount of noise to add, default is NULL

points.pch	pch value to use for stripplot
points.col	colour(s) to use for stripplot (either a single colour or a vector)
points.cex	cex value to use for stripplot
points.alpha	alpha value to use for stripplot
abline.h	Specify the horizontal superimpose line
abline.v	Specify the vertical superimpose line
abline.lty	Specify the superimpose line type
abline.lwd	Specify the superimpose line width
abline.col	Specify the superimpose line colour (defaults to black)
add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x oordinate of the rectangle to be drawn
ybottom.rectangle	Specifies the bottom y coordinate of the rectangle to be drawn
xright.rectangle	Specifies the right x coordinate of the rectangle to be drawn
ytop.rectangle	Specifies the top y coordinate of the rectangle to be drawn
col.rectangle	Specifies the colour of the rectangle to be drawn
alpha.rectangle	Specifies the colour bias of the rectangle to be drawn
box.ratio	ability to change the box width, defaults to 1
col	The colour to fill the interior of the boxplot, defaults to white
alpha	The alpha of the interior boxplot colour specified in 'col'. Defaults to 1 (opaque)
border.col	Colour of the boxplot, defaults to black
symbol.cex	Size of the boxplot outlier-symbol
lwd	Line width, defaults to 1
outliers	logical whether to plot outliers, defaults to TRUE
sample.order	String specifying how samples should be ordered. Either none, increasing, or decreasing.
order.by	A string specifying what the sample order should be ordered by, either max, min, median or mean
xlab.label	The label for the x-axis
ylab.label	The label for the y-axis
xlab.cex	Size of x-axis label, defaults to 3
ylab.cex	Size of y-axis label, defaults to 3
xlab.col	Colour of the x-axis label, defaults to "black"
ylab.col	Colour of the y-axis label, defaults to "black"
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label

xlab.top.col	Colour of the top x-axis label
xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label
xlab.top.y	The y location of the top y-axis label
xlimits	Two-element vector giving the x-axis limits
ylimits	Two-element vector giving the y-axis limits
xat	Accepts a vector listing where x-axis ticks should be drawn or if automatic scaling is desired, one of three strings: “auto”, “auto.linear” or “auto.log”. Automatic scaling fixes x-axis tick locations, labels, and data values dependent on given data. “auto” will determine whether linear or logarithmic scaling fits the given data best, “auto.linear” or “auto.log” will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see ‘auto.axis()’.
yat	Accepts a vector listing where y-axis ticks should be drawn or if automatic scaling is desired, one of three strings: “auto”, “auto.linear” or “auto.log”. Automatic scaling fixes y-axis tick locations, labels, and data values dependent on given data. “auto” will determine whether linear or logarithmic scaling fits the given data best, “auto.linear” or “auto.log” will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see ‘auto.axis()’.
xaxis.lab	Vector listing x-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with xat will overwrite user input. Set to NULL to remove x-axis labels.
yaxis.lab	Vector listing y-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with yat will overwrite user input. Set to NULL to remove y-axis labels.
xaxis.cex	Size of x-axis tick labels, defaults to 2
yaxis.cex	Size of y-axis tick labels, defaults to 2
xaxis.col	Colour of the x-axis tick labels, defaults to “black”
yaxis.col	Colour of the y-axis tick labels, defaults to “black”
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales
xaxis.rot	Rotation of x-axis tick labels; defaults to 0
yaxis.rot	Rotation of y-axis tick labels; defaults to 0
xaxis.tck	Specifies the length of the tick marks for x-axis, defaults to 1 (bottom) and 0 (top)
yaxis.tck	Specifies the length of the tick marks for y-axis, defaults to 1
layout	A vector specifying the number of columns, rows (e.g., c(2,1)). Default is NULL; see lattice::xyplot for more details
.	
as.table	Specifies panel drawing order, default is FALSE which draws panels from bottom left corner, moving right then up. Set to TRUE to draw from top left corner, moving right then down

x.spacing	A number specifying the distance between panels along the x-axis, defaults to 0
y.spacing	A number specifying the distance between panels along the y-axis, defaults to 0
x.relation	Allows x-axis scales to vary if set to “free”, defaults to “same”
y.relation	Allows y-axis scales to vary if set to “free”, defaults to “same”
top.padding	A number specifying the distance to the top margin, defaults to 0.5
bottom.padding	A number specifying the distance to the bottom margin, defaults to 2
right.padding	A number specifying the distance to the right margin, defaults to 1
left.padding	A number specifying the distance to the left margin, defaults to 2
ylab.axis.padding	A number specifying the distance of y-axis label to the y-axis, defaults to 0
,	
add.text	Allow additional text to be drawn, default is FALSE
text.labels	Labels for additional text. If the formula contains group, the length of this argument should match with the number of groups.
text.x	The x co-ordinates where additional text should be placed
text.y	The y co-ordinates where additional text should be placed
text.anchor	Part of text that should be anchored to x/y coordinates. Defaults to 'centre'. Use 'left' or 'right' to left or right-align text.
text.col	The colour of additional text
text.cex	The size of additional text
text.fontface	The fontface for additional text
key	Add a key to the plot. See xyplot.
legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See xyplot.
strip.col	Strip background colour, defaults to “white”
strip.cex	Strip title character expansion
strip.fontface	Strip title fontface, defaults to bold
line.func	Function for the line that should be drawn on top of plot
line.from	The starting point of the line on the plot
line.to	The ending point of the line on the plot
line.col	Colour of the line on the plot
line.infront	Should the line appear in front of the plot or not
height	Figure height, defaults to 6 inches
width	Figure width, defaults to 6 inches
size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE

description	Description of image/plot; default NULL.
style	defaults to “BoutrosLab”, also accepts “Nature”, which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
disable.factor.sorting	Disable barplot auto sorting factors alphabetically/numerically

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

```

---

create.colourkey

*Create Colourkey*

---

### Description

A function for generating and placing a colour key. Good for use in multiplots when a smaller colour key is desired.

### Usage

```

create.colourkey(
x,
scale.data = FALSE,
colour.scheme = c(),
total.colours = 99,
colour.centering.value = 0,
colour.alpha = 1,
fill.colour = 'darkgray',
at = NULL,
colourkey.labels.at = NULL,
colourkey.labels = colourkey.labels.at,
colourkey.labels.cex = 1,
placement = NULL
);

```

### Arguments

x	Either a data-frame or a matrix from which the heatmap was created
scale.data	Was the data for the heatmap scaled? Defaults to FALSE.
colour.scheme	Heatmap colouring. Accepts old-style themes, or a vector of either two or three colours that are gradiated to create the final palette.
total.colours	Total number of colours to plot.
colour.centering.value	The center of the colour-map.

`colour.alpha`    Bias to be added to colour selection (uses  $x^{\text{colour.alpha}}$  in mapping).  
`fill.colour`     The background fill (only exposed where missing values are present).  
`at`                A vector specifying the breakpoints along the range of `x`.  
`colourkey.labels.at`  
                   A vector specifying the tick-positions on the colourkey.  
`colourkey.labels`  
                   A vector specifying tick-labels of the colourkey  
`colourkey.labels.cex`  
                   Size of colourkey labels. Defaults to 1  
`placement`        Location and size of the colourkey.

**Value**

Returns a key in the format specified in the `xyplot` documentation.

**Author(s)**

Stephanie Prokopec

**See Also**

`xyplot`, `plotmath`

**Examples**

```

set.seed(1234567890);
x <- outer(-5:5, -5:5, '*') + matrix(nrow = 11, ncol = 11, data = runif(11 * 11));
colnames(x) <- paste('col', 1:11, sep = '-');
rownames(x) <- paste('row', 1:11, sep = '-');

y <- as.data.frame(x);
y$mean <- apply(x,1,mean);

# example of a simple multiplot with colourkey
heatmap1 <- create.heatmap(
  x = t(x),
  filename = NULL,
  clustering.method = 'none',
  scale.data = FALSE,
  yaxis.lab = NA,
  print.colour.key = FALSE,
  colour.scheme = c('chartreuse3', 'white', 'blue'),
  at = seq(-25, 25, 0.01)
);

barplot1 <- create.barplot(
  1:nrow(y) ~ mean,
  y,
  plot.horizontal = TRUE
);

```

```

create.multiplot(
  plot.objects = list(heatmap1, barplot1),
  # filename = tempfile(pattern = 'multiplot_with_colourkey', fileext = '.tiff'),
  plot.layout = c(2,1),
  panel.widths = c(2,1),
  yat = list(1:nrow(y), NULL),
  yaxis.labels = rownames(y),
  xlimits = list(NULL, c(0,1)),

  width = 10,
  height = 8,
  resolution = 500
);

```

---

create.dendrogram      *Generate a dendrogram*

---

## Description

Takes a matrix and creates a row-wise or column-wise dendrogram

## Usage

```

create.dendrogram(
  x,
  clustering.method = 'diana',
  cluster.dimension = 'col',
  distance.method = 'correlation',
  cor.method = 'pearson',
  force.clustering = FALSE,
  same.as.matrix = FALSE
);

```

**Arguments**

`x` A matrix that is used to create the dendrogram

`clustering.method` Method used to cluster the records (can not be none). Accepts all agglomerative clustering methods available in `hclust`, plus “diana” (which is divisive).

`cluster.dimension` Should clustering be performed on the rows or columns of `x`?

`distance.method` Method name of the distance measure to be used for clustering. Defaults to “correlation”. Other supported methods are same as in `?dist`. Also supports “jaccard” which is useful for clustering categorical variables.

`cor.method` The method used for calculating correlation. Defaults to “pearson”

`force.clustering` Binary to over-ride the control that prevents clustering of too-large matrices

`same.as.matrix` Prevents the flipping of the matrix that the function normally does

**Value**

Returns an object of the dendrogram class corresponding to the row-wise or column-wise dendrogram for `x`

**Author(s)**

Lauren Chong

**Examples**

```
# create temp data
x <- outer(-5:5, -5:5, '*') + matrix(nrow = 11, ncol = 11, data = runif(11 * 11));
colnames(x) <- paste('col', 1:11, sep = '-');
rownames(x) <- paste('row', 1:11, sep = '-');

# example of generating a column-wise dendrogram using default values
create.dendrogram(
  x = x
);

# example of generating a column-wise dendrogram using different distance and clustering methods
create.dendrogram(
  x = x,
  clustering.method = 'median',
  cluster.dimension = 'cols',
  distance.method = 'euclidean'
);

# generate row-wise dendrogram using default distance and clustering methods
create.dendrogram(
  x = x,
  cluster.dimension = 'row'
```

```
);  
  
# generate row-wise dendrogram using different distance and clustering methods  
create.dendrogram(  
  x = x,  
  clustering.method = 'ward',  
  cluster.dimension = 'rows',  
  distance.method = 'manhattan'  
);
```

---

create.densityplot      *Make a density plot*

---

### Description

Takes a list of vectors and creates a density-plot with each vector as a separate curve

### Usage

```
create.densityplot(

```

### Arguments

x	A list of vectors, each of which will be plotted as a separate curve in the final plot
filename	Filename for tiff output, or if NULL returns the trellis object itself
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title, defaults to 2
xlab.label	The label for the x-axis
ylab.label	The label for the y-axis, defaults to “Density”
xlab.cex	Size of x-axis label, defaults to 2
ylab.cex	Size of y-axis label, defaults to 2
xlab.col	Colour of the x-axis label, defaults to “black”
ylab.col	Colour of the y-axis label, defaults to “black”
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label
xlab.top.col	Colour of the top x-axis label
xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label
xlab.top.y	The y location of the top y-axis label
type	Plot type
lty	Line type
cex	Character expansion for plotting symbol
pch	Plotting character
col	Point/line colour
lwd	Thickness of width of any best-fit lines
bandwidth	Smoothing bandwidth, or character string giving rule to choose bandwidth ('nrd0', 'nrd', 'ucv', 'bcv', 'sj', or 'sj-ste'). Passed to base R function density.
bandwidth.adjust	Adjustment parameter for the bandwidth (bandwidth used is bandwidth*bandwidth.adjust). Makes it easy to specify bandwidth as a proportion of the default.

xlimits	Two-element vector giving the x-axis limits, defaults to automatic
ylimits	Two-element vector giving the y-axis limits, defaults to automatic
xat	Vector listing where the x-axis labels should be drawn, defaults to automatic
yat	Vector listing where the y-axis labels should be drawn, defaults to automatic
xaxis.lab	Vector listing x-axis tick labels, defaults to automatic
yaxis.lab	Vector listing y-axis tick labels, defaults to automatic
xaxis.cex	Size of x-axis tick labels, defaults to 1
yaxis.cex	Size of x-axis tick labels, defaults to 1
xaxis.rot	Rotation of x-axis tick labels; defaults to 0
yaxis.rot	Rotation of y-axis tick labels; defaults to 0
xaxis.col	Colour of the x-axis tick labels, defaults to “black”
yaxis.col	Colour of the y-axis tick labels, defaults to “black”
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales
xaxis.tck	Specifies the length of the tick marks for x-axis, defaults to 1
yaxis.tck	Specifies the length of the tick marks for y-axis, defaults to 1
xgrid.at	Vector listing where the x-axis grid lines should be drawn, defaults to xat
ygrid.at	Vector listing where the y-axis grid lines should be drawn, defaults to yat
key	A list giving the key (legend). The default suppresses drawing
legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See xyplot.
top.padding	A number giving the top padding in multiples of the lattice default
bottom.padding	A number giving the bottom padding in multiples of the lattice default
left.padding	A number giving the left padding in multiples of the lattice default
right.padding	A number giving the right padding in multiples of the lattice default
add.axes	Allow axis lines to be turned on or off
abline.h	Specify the superimposed horizontal line(s)
abline.v	Specify the superimposed vertical line(s)
abline.lty	Specify the superimposed line type
abline.lwd	Specify the superimposed line width
abline.col	Specify the superimposed line colour (defaults to black)
add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x coordinate of the rectangle to be drawn
ybottom.rectangle	Specifies the bottom y coordinate of the rectangle to be drawn
xright.rectangle	Specifies the right x coordinate of the rectangle to be drawn

ytop.rectangle	Specifies the top y coordinate of the rectangle to be drawn
col.rectangle	Specifies the colour to fill the rectangle's area
alpha.rectangle	Specifies the colour bias of the rectangle to be drawn
add.text	Allow additional text to be drawn, default is FALSE
text.labels	Labels for additional text
text.x	The x co-ordinates where additional text should be placed
text.y	The y co-ordinates where additional text should be placed
text.anchor	Part of text that should be anchored to x/y coordinates. Defaults to 'centre'. Use 'left' or 'right' to left or right-align text.
text.col	The colour of additional text
text.cex	The size of additional text
text.fontface	The fontface for additional text
height	Figure height, defaults to 6 inches
width	Figure width, defaults to 6 inches
size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
description	Short description of image/plot; default NULL.
style	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
inside.legend.auto	boolean specifying whether or not to use the automatic inside legend function

### Value

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

### Warning

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

---

create.dotmap

---

*Make a dotmap with coloured background*

---

### Description

Takes two data.frames and creates a dotmap with a coloured background. A dotmap is an ordered array of evenly-spaced dots whose size and colour can be user-specified to represent characteristics. For example, size gives the absolute magnitude of the correlation and colour gives the sign of the correlation. The coloured background may indicate p-values.

### Usage

```

create.dotmap(
  x,
  bg.data = NULL,
  filename = NULL,
  main = NULL,
  main.just = "center",
  main.x = 0.5,
  main.y = 0.5,
  pch = 19,
  pch.border.col = 'black',
  add.grid = TRUE,
  xaxis.lab = colnames(x),
  yaxis.lab = rownames(x),
  xaxis.rot = 0,
  yaxis.rot = 0,
  main.cex = 3,
  xlab.cex = 2,
  ylab.cex = 2,
  xlab.label = NULL,
  ylab.label = NULL,
  xlab.col = 'black',
  ylab.col = 'black',
  xlab.top.label = NULL,
  xlab.top.cex = 2,
  xlab.top.col = 'black',

```

```
xlab.top.just = "center",
xlab.top.x = 0.5,
xlab.top.y = 0,
xaxis.cex = 1.5,
yaxis.cex = 1.5,
xaxis.col = 'black',
yaxis.col = 'black',

remove.symmetric = FALSE,
      lwd = 2
);

```

### Arguments

<code>x</code>	An unstacked data.frame to plot the dotmap
<code>bg.data</code>	An unstacked data.frame to plot the background, of the same size as “x”. Column names specified here may be arbitrary: they are not used in the plot.
<code>filename</code>	Filename for tiff output, or if NULL returns the trellis object itself
<code>pch</code>	Plotting character
<code>pch.border.col</code>	Colour of the dot border if using <code>pch = 21:25</code>
<code>add.grid</code>	Should a grid of black-lines separating each column/row be added?
<code>main</code>	The main title for the plot (space is reclaimed if NULL)
<code>main.just</code>	The justification of the main title for the plot, default is centered
<code>main.x</code>	The x location of the main title, default is 0.5
<code>main.y</code>	The y location of the main title, default is 0.5
<code>xlab.label</code>	The label for the x-axis
<code>ylab.label</code>	The label for the y-axis
<code>xlab.col</code>	Colour of the x-axis label, defaults to “black”
<code>ylab.col</code>	Colour of the y-axis label, defaults to “black”
<code>xlab.top.label</code>	The label for the top x-axis
<code>xlab.top.cex</code>	Size of top x-axis label
<code>xlab.top.col</code>	Colour of the top x-axis label
<code>xlab.top.just</code>	Justification of the top x-axis label, defaults to centered
<code>xlab.top.x</code>	The x location of the top x-axis label
<code>xlab.top.y</code>	The y location of the top y-axis label
<code>main.cex</code>	Size of text for the main title, defaults to 2

xlab.cex	Size of x-axis label, defaults to 2
ylab.cex	Size of y-axis label, defaults to 2
xaxis.lab	Vector listing x-axis tick labels, defaults to colnames(x)
yaxis.lab	Vector listing y-axis tick labels, defaults to rownames(x)
xaxis.cex	Size of x-axis tick labels, defaults to 1.2
yaxis.cex	Size of y-axis tick labels, defaults to 1.5
xaxis.rot	Rotation of x-axis tick labels; defaults to 0
yaxis.rot	Rotation of y-axis tick labels; defaults to 0
xaxis.col	Colour of the x-axis tick labels, defaults to “black”
yaxis.col	Colour of the y-axis tick labels, defaults to “black”
xaxis.tck	Specifies the length of the tick marks for x-axis, defaults to 1
yaxis.tck	Specifies the length of the tick marks for y-axis, defaults to 1
axis.top	Specifies the padding on the top of the plot
axis.bottom	Specifies the padding on the bottom of the plot
axis.left	Specifies the padding on the left of the plot
axis.right	Specifies the padding on the right of the plot
top.padding	A number specifying the distance to the top margin, defaults to 0.1
bottom.padding	A number specifying the distance to the bottom margin, defaults to 0.7
right.padding	A number specifying the distance to the right margin, defaults to 0.1
left.padding	A number specifying the distance to the left margin, defaults to 0.5
key.ylab.padding	a number specifying distance between key and left label
key	A list giving the key (legend). The default suppresses drawing. If the key has a “space” component then extra space will be cleared on that side of the plot for the key
legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See xyplot.
col.lwd	Thickness of column grid lines
row.lwd	Thickness of row grid lines
spot.size.function	The function that translates values in x into dotmap spot-size. The default is $0.1 + (2 * \text{abs}(x))$
spot.colour.function	The function that translates values in x into dotmap spot-colour. The default gives negative values blue, positive values red, and zero white. Parameter also accepts ‘columns’ and ‘rows’, which groups the dot colours by columns or rows (not both), respectively. For column/row grouping, there are 12 unique colours and these colours will start to repeat once there are more than 12 columns/rows.
na.spot.size	The size for plotting character for NA cells. Defaults to 7.
na.pch	The type of plotting character to represent NA cells. Defaults to 4 (‘X’).

na.spot.size.colour	Colour for plotting character representing NA cells. Defaults to black.
grid.colour	The colour for the grid lines. DEPRECATED
colour.scheme	Background colouring. Accepts a vector of colours. Vectors of two or three colours are graduated to create the final palette. Defaults to “white”.
total.colours	Total number of colours to plot for the Background colours
at	A vector specifying the breakpoints along the range of bg; each interval specified by these breakpoints are assigned to a colour from the palette. Defaults to NULL, which corresponds to the range of bg being divided into total.colours equally spaced intervals. If bg has values outside of the range specified by “at”, those values are shown with colours corresponding to the extreme ends of the colour spectrum and a warning is given.
colour.centering.value	What should be the center of the background key
colourkey	Determines if the colour key should be added or not and sets up its formatting. Defaults to FALSE.
colourkey.labels.at	A vector specifying the tick-positions on the background colourkey
colourkey.labels	A vector specifying tick-labels of the background colourkey
colourkey.cex	Size of the background colourkey label text
colour.alpha	Bias to be added to background colour selection (uses $x^{\text{colour.alpha}}$ in mapping)
bg.alpha	The alpha value of the background colours, defaults to 0.5 so that the background does not compete with the dot colours for attention.
fill.colour	The background fill colour (only exposed where missing values are present). Defaults to white. NOTE: If you change this colour, you may want to set bg.alpha to 1 to avoid the fill colour showing through
key.top	A number specifying the distance at top of key, defaults to 0.1
height	Figure height in size.units
width	Figure width in size.units
size.units	Units of size for the figure
resolution	Figure resolution in dpi
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
col.colour	The colour for the column grid lines, defaults to “black”. Can be a vector.
row.colour	The colour for the row grid lines, defaults to “black”. Can be a vector.
description	Description of image/plot; default NULL.
add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x oordinate of the rectangle to be drawn

ybottom.rectangle	Specifies the bottom y coordinate of the rectangle to be drawn
xright.rectangle	Specifies the right x coordinate of the rectangle to be drawn
ytop.rectangle	Specifies the top y coordinate of the rectangle to be drawn
col.rectangle	Specifies the colour to fill the rectangle's area
alpha.rectangle	Specifies the colour bias of the rectangle to be drawn
border.rectangle	Specifies the colour of the rectangle border
lwd.rectangle	Specifies the thickness of the rectangle border
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales
dot.colour.scheme	Colour Scheme for the dots
style	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
remove.symmetric	boolean to set whether or not to remove the top left half of a symmetrically sized matrix
lwd	line width for the axis lines

## Details

It would be nice to have a library of suitable `spot.size` and `spot.colour` functions.

Earlier ideas included:

- (1) Changing the dot shape to triangles, so that upward or downward-pointing dots indicated direction
- (2) Adding arrows above or below dots to indicate direction of change. This idea was not used because t
- (3) Adding line(s) in the background set at different angles to show data. This was found to be not int

A future addition may be to add the option of outlining boxes instead of adding a background. This would b

## Value

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

```

**Description**

Takes a function and several sets of parameters and makes a gif of their function calls

**Usage**

```
create.gif(  
  exec.func,  
  parameters,  
  number.of.frames,  
  delay = 40,  
  filename)
```

**Arguments**

<code>exec.func</code>	The function that will be used to make the plots for the gif
<code>parameters</code>	Parameter list to be sent to the exec func at each frame
<code>number.of.frames</code>	Total number of frames to be made (must match number of parameter lists)
<code>delay</code>	Delay between each frame in the gif
<code>filename</code>	Name of output file (must end in .gif)

**Author(s)**

Jeffrey Green

**See Also**

[stripplot](#), [lattice](#) or the Lattice book for an overview of the package.

**Examples**

```
set.seed(223);  
  
simple.data1 <- data.frame(  
  x = sample(1:15, 10),  
  y = LETTERS[1:10]  
);

## Arguments

<code>x</code>	Either a data-frame or a matrix from which the heatmap is to created
<code>filename</code>	Filename for tiff output, or if NULL returns the trellis object itself
<code>clustering.method</code>	Method used to cluster the records – “none” gives unclustered data. Accepts all agglomerative clustering methods available in <code>hclust</code> , plus “diana” (which is divisive).
<code>cluster.dimensions</code>	Should clustering be performed on rows, columns, or both – supersedes setting of <code>plot.dendrograms</code>
<code>rows.distance.method</code>	Method name of the distance measure between rows to be used for clustering. Defaults to “correlation”. Other supported methods are same as in <code>?dist</code> . Also supports “jaccard” which is useful for clustering categorical variables. “euclidean” is sometimes more robust when ties cause “Unclusterable matrix: some col-distances are null” errors. Note, rows and cols are switched due an internal transposition of the data.
<code>cols.distance.method</code>	Method name of the distance measure between columns to be used for clustering. Defaults to “correlation”. Other supported methods are same as in <code>?dist</code> . Also supports “jaccard” which is useful for clustering categorical variables. “euclidean” is sometimes more robust when ties cause “Unclusterable matrix: some

	col-distances are null” errors. Note, rows and cols are switched due an internal transposition of the data.
cor.method	The method used for calculating correlation. Defaults to “pearson”
row.dendrogram	A dendrogram object corresponding to the heatmap rows. If provided, row clustering cannot be performed
col.dendrogram	A dendrogram object corresponding to the heatmap columns. If provided, column clustering cannot be performed
plot.dendrograms	If clustering is performed or dendrograms are provided, which dendrograms should be plotted – “none”, “right”, “top”, or “both”
force.clustering	Binary to over-ride the control that prevents clustering of too-large matrices
criteria.list	A vector indicating which rows should be retained
covariates	Any row-wise covariate annotate to add to the plot, as a fully formed list (placed on right side of plot)
covariates.grid.row	A list of parameters passed to gpar specifying the behaviour of row lines in the right covariate bars
covariates.grid.col	A list of parameters passed to gpar specifying the behaviour of column lines in the right covariate bars
covariates.grid.border	A list of parameters passed to gpar specifying the behaviour of the border around the right covariate bars
covariates.row.lines	Vector of row indices where grid lines should be drawn on the right covariate bars. If NULL (default), all row lines are drawn. Ignored if covariates.grid.row is not specified
covariates.col.lines	Vector of column indices where grid lines should be drawn on the right covariate bars. If NULL (default), all column lines are drawn. Ignored if covariates.grid.col is not specified
covariates.reorder.grid.index	Boolean specifying whether grid line indices for the right covariate bars should be re-ordered with clustering
covariates.padding	Amount of empty space (in “lines”) to place between the right covariate bars and dendrogram
covariates.top	Any column-wise covariate annotate to add to the plot, as a fully formed list
covariates.top.grid.row	A list of parameters passed to gpar specifying the behaviour of row lines in the top covariate bars
covariates.top.grid.col	A list of parameters passed to gpar specifying the behaviour of column lines in the top covariate bars

<code>covariates.top.grid.border</code>	A list of parameters passed to <code>gpar</code> specifying the behaviour of the border around the top covariate bars
<code>covariates.top.row.lines</code>	Vector of row indices where grid lines should be drawn on the top covariate bars. If <code>NULL</code> (default), all row lines are drawn. Ignored if <code>covariates.top.grid.row</code> is not specified
<code>covariates.top.col.lines</code>	Vector of column indices where grid lines should be drawn on the top covariate bars. If <code>NULL</code> (default), all column lines are drawn. Ignored if <code>covariates.top.grid.col</code> is not specified
<code>covariates.top.reorder.grid.index</code>	Boolean specifying whether grid line indices for the top covariate bars should be re-ordered with clustering
<code>covariates.top.padding</code>	Amount of empty space (in “lines”) to place between the top covariate bars and dendrogram
<code>covariate.legends</code>	A list defining covariate legends to add to the plot. See <code>legends</code> argument of <code>legend.grob</code> for more information
<code>legend.cex</code>	Size of text labels in covariate legends, defaults to 1
<code>legend.title.cex</code>	Size of title text in covariate legends, defaults to 1
<code>legend.title.just</code>	Justification of title text in covariate legends, defaults to “centre”
<code>legend.title.fontface</code>	Font face of title text in covariate legends – “plain”, “bold”, “italic”, etc.
<code>legend.border</code>	A list of parameters passed to <code>gpar</code> specifying line options for the legend border, defaults to <code>NULL</code> (no border drawn)
<code>legend.border.padding</code>	The amount of empty space (split equally on both sides) to add between the legend and its border, in “lines” units
<code>legend.layout</code>	Numeric vector of length 2 specifying the number of columns and rows for the legend layout, defaults to a logical layout based on <code>legend.side</code>
<code>legend.between.col</code>	Amount of space to add between columns in the layout, in “lines” units
<code>legend.between.row</code>	Amount of space to add between rows in the layout, in “lines” units
<code>legend.side</code>	Side of the plot where the legends should be drawn – “left”, “right”, or “top”
<code>main</code>	The main title for the plot (space is reclaimed if <code>NULL</code> )
<code>main.just</code>	The justification of the main title for the plot, default is centered
<code>main.x</code>	The x location of the main title, default is 0.5
<code>main.y</code>	The y location of the main title, default is 0.5
<code>main.cex</code>	Size of text for main plot title, defaults to 2.5

<code>right.size.add</code>	The size of each extra covariate row in the right dendrogram in units of “lines”
<code>top.size.add</code>	The size of each extra covariate row in the top dendrogram in units of “lines”
<code>right.dendrogram.size</code>	Size of right dendrogram
<code>top.dendrogram.size</code>	Size of top dendrogram
<code>scale.data</code>	TRUE/FALSE to do row-wise scaling with mean-centering and sd-scaling
<code>xaxis.lab</code>	A vector of row labels, NA = use existing rownames, NULL = none
<code>xaxis.lab.top</code>	The label for the top x-axis. Required only if you want to print a top *and* bottom xaxis, otherwise use <code>x.alternating = 2</code> for top axis only. Defaults to NULL
<code>yaxis.lab</code>	A vector of col labels, NA = use existing colnames, NULL = none
<code>xaxis.cex</code>	Size of x-axis label text - defaults to values found in a look-up table
<code>xaxis.top.cex</code>	Size of top x axis label text
<code>yaxis.cex</code>	Size of y-axis label text - defaults to values found in a look-up table
<code>xaxis.rot</code>	Rotation of x-axis tick labels; defaults to 90
<code>xaxis.rot.top</code>	Rotation of the top x-axis tick labels; defaults to 90
<code>yaxis.rot</code>	Rotation of y-axis tick labels; defaults to 0
<code>xaxis.col</code>	Colour of the x-axis tick labels, defaults to “black”
<code>yaxis.col</code>	Colour of the y-axis tick labels, defaults to “black”
<code>xlab.label</code>	The label for the x-axis
<code>ylab.label</code>	The label for the y-axis
<code>xlab.cex</code>	Size of x-axis label, defaults to 2
<code>ylab.cex</code>	Size of y-axis label, defaults to 2
<code>xlab.col</code>	Colour of the x-axis label, defaults to “black”
<code>ylab.col</code>	Colour of the y-axis label, defaults to “black”
<code>xlab.top.label</code>	The label for the top x-axis
<code>xlab.top.cex</code>	Size of top x-axis label
<code>xlab.top.col</code>	Colour of the top x-axis label
<code>xlab.top.just</code>	Justification of the top x-axis label, defaults to centered
<code>xlab.top.x</code>	The x location of the top x-axis label
<code>xlab.top.y</code>	The y location of the top y-axis label
<code>xat</code>	Vector listing where the x-axis labels should be drawn, defaults to automatic
<code>xat.top</code>	Vector listing where the x-axis labels should be drawn on the top of the plot. Required only when you want bottom and top axis, otherwise use <code>x.alternating = 2</code> , to get top axis only. Defaults to NULL
<code>yat</code>	Vector listing where the y-axis labels should be drawn, defaults to automatic
<code>xaxis.tck</code>	Size of x-axis tick marks. Defaults to NULL for intelligent choice based on covariate size.

<code>xaxis.top.tck</code>	Size of top x-axis tick marks. Defaults to NULL for intelligent choice based on covariate size.
<code>yaxis.tck</code>	Size of y-axis tick marks. Defaults to NULL for intelligent choice based on covariate size.
<code>col.pos</code>	Vector of column positions for adding text to cell, defaults to NULL
<code>row.pos</code>	Vector of row positions for adding text to cell, defaults to NULL
<code>cell.text</code>	Text to add to cell, defaults to an empty string
<code>text.fontface</code>	1 = Plain, 2 = Bold, 3 = Italic, default is 1
<code>text.cex</code>	Text size, default is 1
<code>text.col</code>	Text colour, default is black.
<code>text.position</code>	The position of the text, defaults to center.
<code>text.offset</code>	The offset of the position, defaults to 0.
<code>text.use.grid.coordinates</code>	Indetifier if grid coordinates or npc coordinates should be used
<code>colourkey.cex</code>	Size of colourkey label text
<code>axes.lwd</code>	Width of heatmap border. Note it also changes the colourkey border and ticks
<code>gridline.order</code>	Character specifying order in which to draw interior grid-lines ('h' or 'v'). Defaults to 'h' for horizontal first.
<code>grid.row</code>	Allow turning off of the interior grid-lines. Default FALSE
<code>grid.col</code>	Allow turning off of the interior grid-lines. Default FALSE
<code>force.grid.row</code>	Overrides default behaviour of turning off grid lines when number of rows exceed <code>grid.limit</code> . Defaults to FALSE
<code>force.grid.col</code>	Overrides default behaviour of turning off grid lines when number of columns exceed <code>grid.limit</code> . Defaults to FALSE
<code>grid.limit</code>	Limit set for when to turn off column and row lines if data size exceeds it. Defaults to 50
<code>row.lines</code>	Vector specifying location of lines, default is <code>seq(1, ncol(x), 1) + 0.5</code> . Note: Add 0.5 to customized vector
<code>col.lines</code>	Vector specifying location of lines, default is <code>seq(1, nrow(x), 1) + 0.5</code> . Note: Add 0.5 to customized vector
<code>colour.scheme</code>	Heatmap colouring. Accepts old-style themes, or a vector of either two or three colours that are gradiated to create the final palette.
<code>total.colours</code>	Total number of colours to plot
<code>colour.centering.value</code>	What should be the center of the colour-map
<code>colour.alpha</code>	Bias to be added to colour selection (uses $x^{\text{colour.alpha}}$ in mapping). Set to "automatic" for auto-adjustment.
<code>fill.colour</code>	The background fill (only exposed where missing values are present)
<code>print.colour.key</code>	Should the colour key be printed at all?

at	A vector specifying the breakpoints along the range of x; each interval specified by these breakpoints are assigned to a colour from the palette. Defaults to NULL, which corresponds to the range of x being divided into total.colours equally spaced intervals. If x has values outside of the range specified by “at” those values are shown with the colours corresponding to the extreme ends of the colour spectrum and a warning is given.
colourkey.labels.at	A vector specifying the tick-positions on the colourkey
colourkey.labels	A vector specifying tick-labels of the colourkey
top.padding	A number specifying the distance to the top margin, defaults to 0.1
bottom.padding	A number specifying the distance to the bottom margin, defaults to 0.5
right.padding	A number specifying the distance to the right margin, defaults to 0.5
left.padding	A number specifying the distance to the left margin, defaults to 0.5
x.alternating	A value specifying the position of the col names, defaults to 1. 1 means below the graph, 2 means above the graph. Use 3 to get tick marks below and above graph, but still need to specify xat.top and xaxis.lab.top to get values there
shrink	Allows rectangles to be scaled, defaults to 1
row.colour	Interior grid-line colour, defaults to “black”. Can be a vector
col.colour	Interior grid-line colour, defaults to “black”. Can be a vector
row.lwd	Interior grid-line width, defaults to 1. Setting to zero is equivalent to grid.row = FALSE and grid.col = FALSE. Can be a vector.
col.lwd	Interior grid-line width, defaults to 1. Setting to zero is equivalent to grid.row = FALSE and grid.col = FALSE. Can be a vector.
grid.colour	Interior grid-line colour, defaults to “black”. Can be a vector. Applies to both rows and columns. DEPRECATED
grid.lwd	Interior grid-line width, defaults to 1. Setting to zero is equivalent to grid.row = FALSE and grid.col = FALSE. Applies to both rows and columns. DEPRECATED
width	Figure width in size.units
height	Figure height in size.units
size.units	Units of size for the figure
resolution	Figure resolution in dpi
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
xaxis.covariates	Any column-wise covariate annotate to add to the plot, as a fully formed list
xaxis.covariates.y	The y coordinate of the location of the x axis covariates
yaxis.covariates	Any row-wise covariate annotate to add to the plot, as a fully formed list
yaxis.covariates.x	The x coordinate of the lcoation of the y axis covariates

description	Short description of image/plot; default NULL.
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales
symbols	Extra symbols to be added (borders, squares and circles)
same.as.matrix	Prevents the flipping of the matrix that the function normally does
input.colours	boolean expressing whether or not the matrix was specified using colours or integer values. Defaults to FALSE
axis.xlab.padding	Padding between axis of plot and x label
stratified.clusters.rows	the row locations of the rows to be combined into a strata
stratified.clusters.cols	the column locations of the columns to be combined into a strata
inside.legend	legend specification for the inside legend/key of the heatmap
style	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)

### Value

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

### Warning

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the heatmap. In particular, if a script that uses such a call of create heatmap is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

Note that we would very much like to be able to pass `xaxis.cex` and `yaxis.cex` as vectors of the same length as the actual data-table. However lattice does not support that, because it currently expects them as a two-element vectors to specify left/right or top/bottom axes separately. I've raised a bug report on requesting an enhancement, but this would require an API change so... not sure if it will happen. Here's the bug-report: [https://r-forge.r-project.org/tracker/index.php?func=detail&aid=1702&group\\_id=638&at](https://r-forge.r-project.org/tracker/index.php?func=detail&aid=1702&group_id=638&at)

### Arguments

formula	The formula used to extract the x & y components from the data-frame. Transforming data within formula is not compatible with automatic scaling with 'xat' or 'yat'.
data	The data-frame to plot
filename	Filename for tiff output, or if NULL (default value) returns the trellis object itself
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of the main plot title
aspect	This argument controls the physical aspect ratio of the panels, defaults to "xy"
trans	function specifying a transformation for the counts such as log, defaults to NULL
inv	the inverse transformation of trans, defaults to NULL
colour.scheme	colour scheme to be used, default NULL gives LinGray colour scale
colourkey	logical whether a legend should be drawn, defaults to TRUE
colourcut	Vector of values covering [0, 1] that determine hexagon colour class boundaries and hexagon legend size boundaries. Alternatively, an integer ( $\leq$ maxcnt) specifying the number of equispaced colourcut values in [0,1].
mincnt	Cells with fewer counts are ignored
maxcnt	Cells with more counts are ignored, defaults to auto-generation
xbins	Number of bins to use in x, defaults to 30
legend.title	character/expression to use in place of default legend title or a named list with elements: lab, x, y; defaults to NULL
xlab.label	X-axis label
ylab.label	Y-axis label
xlab.cex	Size of x-axis label
ylab.cex	Size of y-axis label
xlab.col	Colour of the x-axis label, defaults to "black"
ylab.col	Colour of the y-axis label, defaults to "black"
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label

xlab.top.col	Colour of the top x-axis label
xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label
xlab.top.y	The y location of the top y-axis label
xlimits	Two-element vector giving the x-axis limits
ylimits	Two-element vector giving the y-axis limits
xat	Accepts a vector listing where x-axis ticks should be drawn or if automatic scaling is desired, one of three strings: “auto”, “auto.linear” or “auto.log”. Automatic scaling fixes x-axis tick locations, labels, and data values dependent given data. “auto” will determine whether linear or logarithmic scaling fits the given data best, “auto.linear” or “auto.log” will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see ‘auto.axis()’.
yat	Accepts a vector listing where y-axis ticks should be drawn or if automatic scaling is desired, one of three strings: “auto”, “auto.linear” or “auto.log”. Automatic scaling fixes y-axis tick locations, labels, and data values dependent given data. “auto” will determine whether linear or logarithmic scaling fits the given data best, “auto.linear” or “auto.log” will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see ‘auto.axis()’.
xaxis.lab	Vector listing x-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with xat will overwrite user input. Set to NULL to remove x-axis labels.
yaxis.lab	Vector listing y-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with yat will overwrite user input. Set to NULL to remove y-axis labels.
xaxis.cex	Size of x-axis scales, defaults to 2
yaxis.cex	Size of y-axis scales, defaults to 2
xaxis.rot	Rotation of x-axis tick labels; defaults to 0
yaxis.rot	Rotation of y-axis tick labels; defaults to 0
xaxis.col	Colour of the x-axis tick labels, defaults to “black”
yaxis.col	Colour of the y-axis tick labels, defaults to “black”
xaxis.tck	Specifies the length of the tick marks for x-axis, defaults to 1
yaxis.tck	Specifies the length of the tick marks for y-axis, defaults to 1
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales
layout	A vector specifying the number of columns, rows (e.g., c(2,1)). Default is NULL.
as.table	Specifies panel drawing order, default is FALSE which draws panels from bottom left corner, moving right then up. Set to TRUE to draw from top left corner, moving right then down
x.relation	Allows x-axis scales to vary if set to “free”, defaults to “same”
y.relation	Allows y-axis scales to vary if set to “free”, defaults to “same”
x.spacing	A number specifying the distance between panels along the x-axis, defaults to 0

<code>y.spacing</code>	A number specifying the distance between panels along the y-axis, defaults to 0
<code>strip.col</code>	Strip background colour, defaults to “white”
<code>strip.cex</code>	Strip title character expansion
<code>strip.fontface</code>	Strip title fontface, defaults to bold
<code>add.grid</code>	Allows grid lines to be turned on or off
<code>abline.h</code>	Specify the superimposed horizontal line(s)
<code>abline.v</code>	Specify the superimposed vertical line(s)
<code>abline.lty</code>	Specify the superimposed line type
<code>abline.lwd</code>	Specify the superimposed line width
<code>abline.col</code>	Specify the superimposed line colour (defaults to black)
<code>abline.front</code>	If an abline and/or a grid has been added, this controls whether they are drawn in front of the hexbins
<code>add.xyline</code>	Allow $y=x$ line to be drawn, default is FALSE
<code>xyline.col</code>	$y=x$ line colour, defaults to black
<code>xyline.lwd</code>	Specifies $y=x$ line width, defaults to 1
<code>xyline.lty</code>	Specifies $y=x$ line style, defaults to 1 (solid)
<code>add.curves</code>	Allow curves to draw, default is FALSE
<code>curves.exprs</code>	A list of functions, expressions, or calls using “x” as a variable that specify the curves to be drawn
<code>curves.from</code>	Specifies the x co-ordinates at which the start of each curve should be drawn, defaults to drawing the curves to the left edge of the plotting region
<code>curves.to</code>	Specifies the x co-ordinates at which the end of each curve should be drawn, defaults to drawing the curves to the right edge of the plotting region
<code>curves.col</code>	Specifies colours of curves, default is black for each curve
<code>curves.lwd</code>	Specifies width of curves, default is 1 for each curve
<code>curves.lty</code>	Specifies type of curves, default is 1 (solid) for each curve
<code>add.text</code>	Allow additional text to be drawn, default is FALSE
<code>text.labels</code>	Labels for additional text
<code>text.x</code>	The x co-ordinates where additional text should be placed
<code>text.y</code>	The y co-ordinates where additional text should be placed
<code>text.col</code>	The colour of additional text
<code>text.cex</code>	The size of additional text
<code>text.fontface</code>	The fontface for additional text
<code>add.axes</code>	Allow axis lines to be turned on or off
<code>top.padding</code>	A number giving the top padding in multiples of the lattice default
<code>bottom.padding</code>	A number giving the bottom padding in multiples of the lattice default
<code>left.padding</code>	A number giving the left padding in multiples of the lattice default
<code>right.padding</code>	A number giving the right padding in multiples of the lattice default

add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x coordinate of the rectangle to be drawn
ybottom.rectangle	Specifies the bottom y coordinate of the rectangle to be drawn
xright.rectangle	Specifies the right x coordinate of the rectangle to be drawn
ytop.rectangle	Specifies the top y coordinate of the rectangle to be drawn
col.rectangle	Specifies the colour to fill the rectangle's area
alpha.rectangle	Specifies the colour bias of the rectangle to be drawn
background.col	Specifies the colour for the background of the plot
key	Add a key to the plot. See xyplot.
legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See xyplot.
height	Figure height, defaults to 6 inches
width	Figure width, defaults to 6 inches
size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
description	Short description of image/plot; default NULL.
style	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
inside.legend.auto	boolean specifying whether or not to use the automatic inside legend function

## Details

**WARNING:** this function uses highly unusual semantics, different from the rest of the BoutrosLab.plotting.general library. The underlying hexbinplot function uses an argument called maxcnt to specify the maximum number of counts per cell. The default behaviour is not sensibly encoded via a NULL or an NA, but instead by using the `missing` function. As a result, we need to use `do.call` semantics to handle this function. This **can mess up anything using substitute** including things that generate p-values!

## Value

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
If 'maxcnt' is passed, make sure it is not smaller than the actual maximum count (value depends on nbins)
```

**Author(s)**

Maud HW Starmans

**See Also**

### Arguments

x	A formula or a numeric vector (not frequencies!)
data	An optional data source if x is a formula
filename	Filename for tiff output, or if NULL returns the trellis object itself
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered

<code>main.x</code>	The x location of the main title, default is 0.5
<code>main.y</code>	The y location of the main title, default is 0.5
<code>main.cex</code>	Size of text for main plot title, defaults to 2
<code>xlab.label</code>	x-axis title
<code>ylab.label</code>	y-axis title
<code>xlab.cex</code>	Size of x-axis label, defaults to 2
<code>ylab.cex</code>	Size of y-axis label, defaults to 2
<code>xlab.col</code>	Colour of the x-axis label, defaults to “black”
<code>ylab.col</code>	Colour of the y-axis label, defaults to “black”
<code>xaxis.lab</code>	Vector listing x-axis tick labels, defaults to automatic
<code>yaxis.lab</code>	Vector listing y-axis tick labels, defaults to automatic
<code>xaxis.cex</code>	Size of x-axis tick labels, defaults to 1
<code>yaxis.cex</code>	Size of y-axis tick labels, defaults to 1
<code>xlimits</code>	Two-element vector giving the x-axis limits
<code>ylimits</code>	Two-element vector giving the y-axis limits
<code>xat</code>	Vector listing where the x-axis ticks should be drawn
<code>yat</code>	Vector listing where the y-axis ticks should be drawn
<code>xaxis.rot</code>	Rotation of x-axis tick labels; defaults to 0
<code>yaxis.rot</code>	Rotation of y-axis tick labels; defaults to 0
<code>xaxis.col</code>	Colour of the x-axis tick labels, defaults to “black”
<code>yaxis.col</code>	Colour of the y-axis tick labels, defaults to “black”
<code>xaxis.tck</code>	Specifies the length of the tick marks for x-axis, defaults to 1
<code>yaxis.tck</code>	Specifies the length of the tick marks for y-axis, defaults to 1
<code>xaxis.fontface</code>	Fontface for the x-axis scales
<code>yaxis.fontface</code>	Fontface for the y-axis scales
<code>xlab.top.label</code>	The label for the top x-axis
<code>xlab.top.cex</code>	Size of top x-axis label
<code>xlab.top.col</code>	Colour of the top x-axis label
<code>xlab.top.just</code>	Justification of the top x-axis label, defaults to centered
<code>xlab.top.x</code>	The x location of the top x-axis label
<code>xlab.top.y</code>	The y location of the top y-axis label
<code>type</code>	Should the plot be of the “percent” (default), “density” or “count”
<code>breaks</code>	A vector listing the break-points of the histogram, or an integer specifying the desired number of breaks.
<code>col</code>	Fill colour for the histograms
<code>border.col</code>	Specify border colour (defaults to black)
<code>lwd</code>	Specifies line width

lty	Specifies line style
layout	A vector specifying the number of columns, rows (e.g., c(2,1)). Default is NULL; see lattice::xyplot for more details
.	
x.spacing	A number specifying the distance between panels along the x-axis, defaults to 0
y.spacing	A number specifying the distance between panels along the y-axis, defaults to 0
x.relation	Allows x-axis scales to vary if set to “free”, defaults to “same”
y.relation	Allows y-axis scales to vary if set to “free”, defaults to “same”
strip.col	Strip background colour, defaults to “white”
strip.cex	Strip title character expansion
top.padding	A number specifying the distance to the top margin, defaults to 0.1
bottom.padding	A number specifying the distance to the bottom margin, defaults to 0.7
right.padding	A number specifying the distance to the right margin, defaults to 0.5
left.padding	A number specifying the distance to the left margin, defaults to 0.5
ylab.axis.padding	A number specifying the distance of ylabel to the y-axis, defaults to 0
,	
abline.h	Allow horizontal line to be drawn, default to NULL
abline.v	Allow vertical line to be drawn, default to NULL
abline.col	Horizontal and vertical line colour, defaults to black
abline.lwd	Specifies horizontal/vertical line width, defaults to 1
abline.lty	Specifies horizontal/vertical line style, defaults to 1 (solid)
key	Add a key to the plot. See xyplot.
legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See xyplot.
add.text	Allow additional text to be drawn, default is FALSE
text.labels	Labels for additional text
text.x	The x co-ordinates where additional text should be placed
text.y	The y co-ordinates where additional text should be placed
text.col	The colour of additional text
text.cex	The size of additional text
text.fontface	The fontface for additional text
add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x oordinate of the rectangle to be drawn
ybottom.rectangle	Specifies the bottom y coordinate of the rectangle to be drawn

xright.rectangle	Specifies the right x coordinate of the rectangle to be drawn
yttop.rectangle	Specifies the top y coordinate of the rectangle to be drawn
col.rectangle	Specifies the colour to fill the rectangle's area
alpha.rectangle	Specifies the colour bias of the rectangle to be drawn
height	Figure height, defaults to 6 inches
width	Figure width, defaults to 6 inches
size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
description	Short description of image/plot; default NULL.
style	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
inside.legend.auto	boolean specifying whether or not to use the automatic inside legend function

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

**Author(s)**

```

### Arguments

formula	The formula used to extract the x & y components from the data-frame
data	The data-frame to plot
filename	Filename for tiff output, or if NULL returns the trellis object itself
groups	The grouping variable in the data-frame
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title
xlab.label	x-axis label
ylab.label	y-axis label

xlab.cex	Size of x-axis label, defaults to 3
ylab.cex	Size of y-axis label, defaults to 3
xlab.col	Colour of the x-axis label, defaults to “black”
ylab.col	Colour of the y-axis label, defaults to “black”
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label
xlab.top.col	Colour of the top x-axis label
xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label
xlab.top.y	The y location of the top y-axis label
xlimits	Two-element vector giving the x-axis limits, defaults to automatic
ylimits	Two-element vector giving the y-axis limits, defaults to automatic
xat	Vector listing where the x-axis labels should be drawn, defaults to automatic
yat	Vector listing where the y-axis labels should be drawn, defaults to automatic
xaxis.lab	Vector listing x-axis tick labels, defaults to automatic
yaxis.lab	Vector listing y-axis tick labels, defaults to automatic
xaxis.log	Logical indicating whether x-variable should be in logarithmic scale (and what base if numeric)
yaxis.log	Logical indicating whether y-variable should be in logarithmic scale (and what base if numeric)
xaxis.cex	Size of x-axis scales, defaults to 2
yaxis.cex	Size of y-axis scales, defaults to 2
xaxis.rot	Counterclockwise rotation of text in x-axis scales in degrees, defaults to 0
yaxis.rot	Counterclockwise rotation of text in y-axis scales in degrees, defaults to 0
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales
xaxis.col	Colour of the x-axis tick labels, defaults to “black”
yaxis.col	Colour of the y-axis tick labels, defaults to “black”
xaxis.tck	Specifies the length of the tick mark, defaults to 1 for both top and bottom axes
yaxis.tck	Specifies the length of the tick mark, defaults to 1 for both top and bottom axes
add.grid	Logical stating wheter or not the grid should be drawn on the plot
xgrid.at	Vector listing where the x-axis grid lines should be drawn, defaults to xat
ygrid.at	Vector listing where the y-axis grid lines should be drawn, defaults to yat
grid.colour	ability to set individual grid line colours
horizontal	xyplot-specific function that allows you to change if type='h' draws lines to the vertical or horizontal axis
type	Plot type
cex	Character expansion for plotting symbol

<code>pch</code>	Plotting character
<code>col</code>	Point/line colour
<code>col.border</code>	Colour of border when points <code>pch &gt;= 21</code> . Defaults to “black”
<code>lwd</code>	Specifies line width, defaults to 1
<code>lty</code>	Specifies line style, defaults to 1 (solid)
<code>alpha</code>	Specifies line transparency, defaults to 1 (opaque)
<code>axes.lwd</code>	Thickness of width of axes lines
<code>strip.col</code>	Strip background colour, defaults to “white”
<code>strip.cex</code>	Strip title character expansion
<code>strip.fontface</code>	Strip title fontface, defaults to bold
<code>y.error.up</code>	upward error vector. Defaults to NULL. When <code>y.error.up</code> is NULL, vertical error bar is not drawn
<code>y.error.down</code>	Downward error vector. Defaults to <code>y.error.down</code> to show symmetric error bars
<code>x.error.right</code>	Rightward error vector. Defaults to NULL. When <code>x.error.right</code> is NULL, horizontal error bar is not drawn
<code>x.error.left</code>	Leftward error vector. Defaults to <code>x.error.right</code> to show symmetric error bars
<code>y.error.bar.col</code>	Colour of vertical error bar. Defaults to “black”
<code>x.error.bar.col</code>	Colour of horizontal error bar. Defaults to “black”
<code>error.whisker.angle</code>	Angle of the whisker drawn on error bar. Defaults to 90 degree
<code>error.bar.lwd</code>	Error bar line width. Defaults to 1
<code>error.bar.length</code>	Length of the error bar whiskers. Defaults to 0.1
<code>key</code>	A list giving the key (legend). The default suppresses drawing
<code>legend</code>	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See <code>xyplot</code> .
<code>top.padding</code>	A number specifying the distance to the top margin, defaults to 0.1
<code>bottom.padding</code>	A number specifying the distance to the bottom margin, defaults to 0.7
<code>right.padding</code>	A number specifying the distance to the right margin, defaults to 0.1
<code>left.padding</code>	A number specifying the distance to the left margin, defaults to 0.5
<code>key.top</code>	A number specifying the distance at top of key, defaults to 0.1
<code>key.left.padding</code>	Amount of padding to go onto any legend on the left
<code>ylab.axis.padding</code>	A number specifying the distance of ylabel to the y-axis, defaults to 1
<code>axis.key.padding</code>	A number specifying the distance from the y-axis to the key, defaults to 1
<code>layout</code>	A vector specifying the number of columns, rows (e.g., <code>c(2,1)</code> ). Default is NULL; see <code>lattice::xyplot</code> for more details

as.table	Specifies panel drawing order, default is FALSE which draws panels from bottom left corner, moving right then up. Set to TRUE to draw from top left corner, moving right then down
x.spacing	A number specifying the distance between panels along the x-axis, defaults to 0
y.spacing	A number specifying the distance between panels along the y-axis, defaults to 0
x.relation	Allows x-axis scales to vary if set to “free”, defaults to “same”
y.relation	Allows y-axis scales to vary if set to “free”, defaults to “same”
add.axes	Allow axis lines to be turned on or off, default is FALSE
axes.lty	Specifies axis line style, defaults to “dashed”
add.xyline	Allow y=x line to be drawn, default is FALSE
xyline.col	y=x line colour, defaults to black
xyline.lwd	Specifies y=x line width, defaults to 1
xyline.lty	Specifies y=x line style, defaults to 1 (solid)
abline.h	Allow horizontal line to be drawn, default to NULL
abline.v	Allow vertical line to be drawn, default to NULL
abline.col	Horizontal line colour, defaults to black
abline.lwd	Specifies horizontal line width, defaults to 1
abline.lty	Specifies horizontal line style, defaults to 1 (solid)
add.curves	Allow curves to drawn, default is FALSE
curves.exprs	A list of functions, expressions, or calls using “x” as a variable that specify the curves to be drawn
curves.from	Specifies the x co-ordinates at which the start of each curve should be drawn, defaults to drawing the curves to the left edge of the plotting region
curves.to	Specifies the x co-ordinates at which the end of each curve should be drawn, defaults to drawing the curves to the right edge of the plotting region
curves.col	Specifies colours of curves, default is black for each curve
curves.lwd	Specifies width of curves, default is 1 for each curve
curves.lty	Specifies type of curves, default is 1 (solid) for each curve
add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x oordinate of the rectangle to be drawn
ybottom.rectangle	Specifies the bottom y coordinate of the rectangle to be drawn
xright.rectangle	Specifies the right x coordinate of the rectangle to be drawn
ytop.rectangle	Specifies the top y coordinate of the rectangle to be drawn
col.rectangle	Specifies the colour to fill rectangle’s area
alpha.rectangle	Specifies the colour bias of the rectangle to be drawn
add.points	Allow additional points to be drawn, default is FALSE

<code>points.x</code>	The x co-ordinates where additional points should be drawn
<code>points.y</code>	The y co-ordinates where additional points should be drawn
<code>points.pch</code>	The plotting character for additional points
<code>points.col</code>	The colour of additional points
<code>points.col.border</code>	Colour of the border of additional points if <code>points.pch &gt;= 21</code> . Defaults to black
<code>points.cex</code>	The size of additional points
<code>add.line.segments</code>	Allow additional line segments to be drawn, default is FALSE
<code>line.start</code>	The y co-ordinates where additional line segments should start
<code>line.end</code>	The y co-ordinates where additional line segments should end
<code>line.col</code>	The colour of additional line segments, default is black
<code>line.lwd</code>	The line width of additional line segments, default is 1
<code>add.text</code>	Allow additional text to be drawn, default is FALSE
<code>text.labels</code>	Labels for additional text
<code>text.x</code>	The x co-ordinates where additional text should be placed
<code>text.y</code>	The y co-ordinates where additional text should be placed
<code>text.col</code>	The colour of additional text
<code>text.cex</code>	The size of additional text
<code>text.fontface</code>	The fontface for additional text
<code>text.guess.labels</code>	Allows automatic labeling by considering values in <code>text.x</code> and <code>text.y</code> as a data point to be labelled, default is FALSE
<code>text.guess.skip.labels</code>	Provides an option to disregard automatic labelling algorithm if no space is available around a data point, thus forcing labelling if a collision is likely, default is TRUE
<code>text.guess.ignore.radius</code>	Allows the automatic labeling algorithm to ignore the radius space of a data point, useful to label a cluster of data points with a single text box, default is FALSE
<code>text.guess.ignore.rectangle</code>	Allows the automatic labeling algorithm to ignore the rectangle space of multiple potential label positions, default is FALSE
<code>text.guess.radius.factor</code>	A numeric value to factor the radius value to alter distance from the label and the data point
<code>text.guess.buffer.factor</code>	A numeric value to factor the buffer value to alter the space which is used to consider if data points are potentially going to collide
<code>text.guess.label.position</code>	A numeric value between 0 and 360 to specify the precise angle of a text box center and the positive x-axis. Angles move counter-clockwise beginning at the positive x axis

height	Figure height, defaults to 6 inches
width	Figure width, defaults to 6 inches
size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
description	Short description of image/plot; default NULL
style	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
group.specific.colouring	Variable to specify if group specific multi colouring for error bars is enforced
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
inside.legend.auto	boolean specifying whether or not to use the automatic inside legend function
regions.labels	Labels for each of the regions on the lollipop plots bars
regions.start	start x value of each of the regions
regions.stop	stop value for each of the regions
regions.color	color of each of the regions
regions.cex	size of the text of each of the regions
regions.alpha	alpha of each of the regions
lollipop.bar.y	y location of top of the lollipop plot bar – defaults to right above the bottom y axis
lollipop.bar.color	color of the lollipop plot bar
...	Additional arguments to be passed to xyplot

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

**Author(s)**

Paul C. Boutros

**See Also**[xyplot](#), [lattice](#) or the Lattice book for an overview of the package.**Examples**

```
set.seed(12345);

```

---

create.manhattanplot *Make a Manhattan plot*

---

**Description**

Takes a data.frame and creates a Manhattan plot

**Usage**

```
create.manhattanplot(
  formula,
  data,
```

```
filename = NULL,
main = NULL,
main.just = 'center',
main.x = 0.5,
main.y = 0.5,

```

## Arguments

formula	The formula used to extract the x & y components from the data-frame. Transforming data within formula is not compatible with automatic scaling with 'xat' or 'yat'.
data	The data-frame to plot
filename	Filename for tiff output, or if NULL returns the trellis object itself
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title
xlab.label	x-axis label
ylab.label	y-axis label
xlab.cex	Size of x-axis label, defaults to 2
ylab.cex	Size of y-axis label, defaults to 2
xlab.col	Colour of the x-axis label, defaults to "black"
ylab.col	Colour of the y-axis label, defaults to "black"
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label
xlab.top.col	Colour of the top x-axis label
xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label
xlab.top.y	The y location of the top y-axis label
xlimits	Two-element vector giving the x-axis limits, defaults to automatic
ylimits	Two-element vector giving the y-axis limits, defaults to automatic
xat	Accepts a vector listing where x-axis ticks should be drawn or if automatic scaling is desired, one of three strings: "auto", "auto.linear" or "auto.log". Automatic scaling fixes x-axis tick locations, labels, and data values dependent given data. "auto" will determine whether linear or logarithmic scaling fits the given data best, "auto.linear" or "auto.log" will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see 'auto.axis()'.

<code>yat</code>	Accepts a vector listing where y-axis ticks should be drawn or if automatic scaling is desired, one of three strings: “auto”, “auto.linear” or “auto.log”. Automatic scaling fixes y-axis tick locations, labels, and data values dependent given data. “auto” will determine whether linear or logarithmic scaling fits the given data best, “auto.linear” or “auto.log” will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see ‘auto.axis()’.
<code>xaxis.lab</code>	Vector listing x-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with <code>xat</code> will overwrite user input. Set to NULL to remove x-axis labels.
<code>yaxis.lab</code>	Vector listing y-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with <code>yat</code> will overwrite user input. Set to NULL to remove y-axis labels.
<code>xaxis.log</code>	Logical indicating whether x-variable should be in logarithmic scale (and what base if numeric)
<code>yaxis.log</code>	Logical indicating whether y-variable should be in logarithmic scale (and what base if numeric)
<code>xaxis.cex</code>	Size of x-axis scales, defaults to 1
<code>yaxis.cex</code>	Size of y-axis scales, defaults to 1
<code>xaxis.rot</code>	Counterclockwise rotation of text in x-axis scales in degrees, defaults to 0
<code>yaxis.rot</code>	Counterclockwise rotation of text in y-axis scales in degrees, defaults to 0
<code>xaxis.fontface</code>	Fontface for the x-axis scales
<code>yaxis.fontface</code>	Fontface for the y-axis scales
<code>xaxis.col</code>	Colour of the x-axis tick labels, defaults to “black”
<code>yaxis.col</code>	Colour of the y-axis tick labels, defaults to “black”
<code>xaxis.tck</code>	Specifies the length of the tick mark, defaults to 1 for both top and bottom axes
<code>yaxis.tck</code>	Specifies the length of the tick mark, defaults to 1 for both top and bottom axes
<code>horizontal</code>	xyplot-specific function that allows you to change if type=’h’ draws lines to the vertical or horizontal axis
<code>type</code>	Plot type
<code>cex</code>	Character expansion for plotting symbol
<code>pch</code>	Plotting character
<code>col</code>	Point/line colour
<code>lwd</code>	Specifies line width, defaults to 1
<code>lty</code>	Specifies line style, defaults to 1 (solid)
<code>alpha</code>	Specifies line transparency, defaults to 1 (opaque)
<code>strip.col</code>	Strip background colour, defaults to “white”
<code>strip.cex</code>	Strip title character expansion
<code>axes.lwd</code>	Thickness of width of axis lines
<code>axes.lty</code>	Specifies axis line style, defaults to “dashed”
<code>key</code>	A list giving the key (legend). The default suppresses drawing

legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See xyplot.
layout	A vector specifying the number of columns, rows (e.g., c(2,1)). Default is NULL; see lattice::xyplot for more details
as.table	Specifies panel drawing order, default is FALSE which draws panels from bottom left corner, moving right then up. Set to TRUE to draw from top left corner, moving right then down
F	
x.spacing	A number specifying the distance between panels along the x-axis, defaults to 0
y.spacing	A number specifying the distance between panels along the y-axis, defaults to 0
x.relation	Allows x-axis scales to vary if set to "free", defaults to "same"
y.relation	Allows y-axis scales to vary if set to "free", defaults to "same"
top.padding	A number specifying the distance to the top margin, defaults to 0
bottom.padding	A number specifying the distance to the bottom margin, defaults to 0
right.padding	A number specifying the distance to the right margin, defaults to 0
left.padding	A number specifying the distance to the left margin, defaults to 0
key.top	A number specifying the distance at top of key, defaults to 0
key.left.padding	Amount of padding to go onto any legend on the left
ylab.axis.padding	A number specifying the distance of label to the y-axis, defaults to 1
axis.key.padding	A number specifying the distance from the y-axis to the key, defaults to 1
abline.h	Allow horizontal line to be drawn, default to NULL
abline.col	Horizontal line colour, defaults to black
abline.lwd	Specifies horizontal line width, defaults to 1
abline.lty	Specifies horizontal line style, defaults to 1 (solid)
add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x coordinate of the rectangle to be drawn
ybottom.rectangle	Specifies the bottom y coordinate of the rectangle to be drawn
xright.rectangle	Specifies the right x coordinate of the rectangle to be drawn
ytop.rectangle	Specifies the top y coordinate of the rectangle to be drawn
col.rectangle	Specifies the colour to fill the rectangle's area
alpha.rectangle	Specifies the colour bias of the rectangle to be drawn
add.points	Allow additional points to be drawn, default is FALSE
points.x	The x co-ordinates where additional points should be drawn

points.y	The y co-ordinates where additional points should be drawn
points.pch	The plotting character for additional points
points.col	The colour of additional points
points.cex	The size of additional points
add.text	Allow additional text to be drawn, default is FALSE
text.labels	Labels for additional text
text.x	The x co-ordinates where additional text should be placed
text.y	The y co-ordinates where additional text should be placed
text.col	The colour of additional text
text.cex	The size of additional text
text.fontface	The fontface for additional text
height	Figure height, defaults to 6 inches
width	Figure width, defaults to 6 inches
size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
style	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
description	Short description of image/plot; default NULL
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
inside.legend.auto	boolean specifying whether or not to use the automatic inside legend function
...	Additional arguments to be passed to xyplot

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

description = 'Created with BoutrosLab.plotting.general',
size.units = 'in',
enable.warnings = FALSE,
style = "BoutrosLab",
use.legacy.settings = FALSE
);

```

### Arguments

plot.objects	A list of plot objects. Goes in this order: Top Left, Top Right, Bottom Left, Bottom Right
filename	Filename to output to
height	Height of resulting file
width	Width of resulting file
resolution	Resolution of resulting file
plot.objects.heights	Heights of each row of the plot. Must be vector of same size as layout.height
plot.objects.widths	Widths of each column of the plot. Must be vector of same size as layout.width
layout.width	how many plots per row.
layout.height	how many plots per column
main	main label text
main.x	main label x coordinate
main.y	main label y coordinate
x.spacing	horizontal spacing between each plot. Can be single value or vector of length layout.width - 1
y.spacing	vertical spacing between each plot. Can be single value or vector of length layout.height - 1
xlab.label	bottom x-axis main label
xlab.cex	bottom x-axis main label cex
ylab.label	left side y-axis label
ylab.label.right	right side y-axis label

<code>ylab.cex</code>	y-axis label cex
<code>main.cex</code>	main label cex
<code>legend</code>	legend for the plot
<code>left.padding</code>	padding from the left side of the frame
<code>ylab.axis.padding</code>	padding between axis and y label of plots. Can be single value or vector of length <code>layout.width</code>
<code>xlab.axis.padding</code>	padding between axis and x label of plots. Can be single value or vector of length <code>layout.height</code>
<code>bottom.padding</code>	padding from the bottom side of the frame
<code>top.padding</code>	padding from the top side of the frame
<code>right.padding</code>	padding from the right side of the frame
<code>layout.skip</code>	list specifying locations to skip plots. Must be vector of length <code>layout.width*layout.height</code>
<code>left.legend.padding</code>	padding between legend and left side of figure (can use without a legend)
<code>right.legend.padding</code>	padding between legend and right side of figure (can use without a legend)
<code>bottom.legend.padding</code>	padding between legend and bottom side of figure (can use without a legend)
<code>top.legend.padding</code>	padding between legend and top side of figure (can use without a legend)
<code>description</code>	description of what plot is displaying
<code>size.units</code>	the units the height and width of file represent
<code>enable.warnings</code>	enables warnings to be output
<code>style</code>	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
<code>use.legacy.settings</code>	boolean to set wheter or not to use legacy mode settings (font)

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of `create histogram` is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

### Arguments

plot.objects	A list of plot objects. Goes in this order: Bottom Left, Bottom Right, Top Left, Top Right
filename	Filename for tiff output, or if NULL returns the trellis object itself
panel.heights	A vector specifying relative heights of the panels. Default is c(1,1)
panel.widths	A vector specifying relative widths of the panels. Default is 1
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title, defaults to 3
main.key.padding	A number specifying the distance of main to plot, defaults to 1
ylab.padding	A number specifying the distance of y-axis to plot, defaults to 5
xlab.padding	A number specifying the distance of x-axis to plot, defaults to 5
xlab.to.xaxis.padding	A number specifying the distance between xaxis and xlabel, defaults to 2
right.padding	A number specifying the distance to the right margin, defaults to 1
left.padding	A number specifying the distance to the left margin, defaults to 1
top.padding	A number specifying the distance to the top margin, defaults to 0.5
bottom.padding	A number specifying the distance to the bottom margin, defaults to 0.5
xlab.label	The label for the x-axis
ylab.label	The label for the y-axis
xlab.cex	Size of x-axis labels, defaults to 1.5
ylab.cex	Size of y-axis labels, defaults to 1.5

<code>xlab.top.label</code>	The label for the top x-axis
<code>xaxis.top.tck.lab</code>	A vector of tick labels for the top x-axis. Currently only supports labelling a single top x-axis in the plot
<code>xat.top</code>	A vector specifying tick positions for the top x-axis. Currently only supports a single top x-axis in the plot. Note when labelling a top x-axis even if you're not labelling a bottom x-axis labels <code>xat</code> must still be defined (eg as a list of empty vectors) or it will lead to unpredictable labelling
<code>xlab.top.cex</code>	Size of top x-axis label
<code>xaxis.top.idx</code>	Index of the plot for which you want top x-axis tick labels. Defaults to the last plot specified. Currently only supports one plot.
<code>xlab.top.col</code>	Colour of the top x-axis label
<code>xlab.top.just</code>	Justification of the top x-axis label, defaults to centered
<code>xlab.top.x</code>	The x location of the top x-axis label
<code>xlab.top.y</code>	The y location of the top y-axis label
<code>xaxis.cex</code>	Size of x-axis scales, defaults to 2
<code>yaxis.cex</code>	Size of y-axis scales, defaults to 2
<code>xaxis.labels</code>	Names to give the x-axis labels, defaults to lattice default behaviour
<code>yaxis.labels</code>	Names to give the y-axis labels, defaults to lattice default behaviour
<code>xaxis.alternating</code>	Gives control of axis tick marks (1 bottom only, 2 top only, 3 both top and bottom), default to 1 which means only bottom axis tick marks are drawn, set to 0 to remove tick marks
<code>yaxis.alternating</code>	Gives control of axis labelling, defaults to 1 which means only left axis labels are drawn, set to 0 to remove tick marks
<code>xat</code>	Vector listing where the x-axis labels should be drawn
<code>yat</code>	Vector listing where the y-axis labels should be drawn
<code>xlimits</code>	Vector listing where the x-axis limits should be for each subplot. Defaults to NULL to let R figure out the limits
<code>ylimits</code>	Vector listing where the y-axis limits should be for each subplot. Defaults to NULL to let R figure out the limits
<code>xaxis.rot</code>	Rotation of bottom x-axis labels
<code>xaxis.rot.top</code>	Rotation of top x-axis labels
<code>xaxis.fontface</code>	Fontface for the x-axis scales
<code>yaxis.fontface</code>	Fontface for the y-axis scales
<code>x.spacing</code>	A number specifying the horizontal distance between plots, defaults to 1
<code>y.spacing</code>	A number specifying the vertical distance between plots, defaults to 1
<code>x.relation</code>	A character string that determines how x-axis limits are calculated for each panel. Possible values are "same" (default), "free" and "sliced". See <code>?xyplot</code>

<code>y.relation</code>	A character string that determines how y-axis limits are calculated for each panel. Possible values are “same” (default), “free” and “sliced”. See <code>?xyplot</code>
<code>xaxis.tck</code>	A vector of length 2 that determines the size of x-axis tick marks. Defaults to <code>c(0.75, 0.75)</code> .
<code>yaxis.tck</code>	A vector of length 2 that determines the size of y-axis tick marks. Defaults to <code>c(0.75, 0.75)</code> .
<code>x.tck.dist</code>	A number specifying the distance between x-axis labels and tick marks. Defaults to 0.5.
<code>y.tck.dist</code>	A number specifying the distance between y-axis labels and tick marks. Defaults to 0.5.
<code>axes.lwd</code>	Width of border. Note it also changes the colourkey border and ticks
<code>key.right.padding</code>	Space between right-most plot and any keys/legends
<code>key.left.padding</code>	Space between left-most plot and any keys/legends
<code>key.bottom.padding</code>	Space between bottom-most plot and any keys/legends
<code>xlab.key.padding</code>	Space between bottom-most xlab and any keys/legends
<code>height</code>	Figure height, defaults to 6 inches
<code>width</code>	Figure width, defaults to 6 inches
<code>size.units</code>	Figure units, defaults to inches
<code>resolution</code>	Figure resolution in dpi, defaults to 1600
<code>enable.warnings</code>	Print warnings if set to TRUE, defaults to FALSE
<code>key</code>	Add a key to the plot: see <code>xyplot</code> .
<code>legend</code>	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See <code>?xyplot</code> .
<code>print.new.legend</code>	Override default behaviour of merging legends imported from plots, can specify custom legend, default is FALSE. TRUE will cancel <code>merge.legends</code> functionality
<code>merge.legends</code>	FALSE means only legend from first plot is used, TRUE retrieves legends from all plots. Multiple legends share the same “space”: see <code>c.trellis</code> .
<code>plot.layout</code>	A vector specifying the layout of the plots, defaults to a single column/ <code>c(1,length(plot.objects))</code>
<code>layout.skip</code>	A vector specifying which positions in the layout grid to leave blank/skip, defaults to not skipping any spots in the layout / <code>rep(FALSE,length(plot.objects))</code> . Goes in this order: Bottom Left, Bottom Right, Top Left, Top Right
<code>description</code>	Short description of image/plot; default NULL.
<code>plot.labels.to.retrieve</code>	a vector of the indices referencing which plots in <code>plot.objects</code> should have there limits, at, and axis labels retrived in the multiplot vs using the arguments specified to multiplot

`style` defaults to “BoutrosLab”, also accepts “Nature”, which changes parameters according to Nature formatting requirements  
`remove.all.border.lines` defaults to FALSE. Flag for whether all borders around plots should be removed.  
`preload.default` ability to set multiple sets of different defaults depending on publication needs  
`plot.for.carry.over.when.same` which plot  
`get.dendrogram.from` which plot to retrieve dendrogram from  
`dendrogram.right.size` size of right side dendrogram  
`dendrogram.right.x` x position of right side dendrogram  
`dendrogram.right.y` y position of right side dendrogram  
`dendrogram.top.size` size of top side dendrogram  
`dendrogram.top.x` x position of top side dendrogram  
`dendrogram.top.y` y position of top side dendrogram  
`use.legacy.settings` boolean to set whether or not to use legacy mode settings (font)

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```

Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics

```

### Arguments

formula	The formula used to extract the boxplot components from the data-frame
data	The data-frame to plot
filename	Filename for tiff output, or if NULL returns the trellis object itself
groups	The grouping variable in the data-frame
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title
max	Max values for polygon
min	Min values for polygon
col	Fill colour of polygon, defaults to white
alpha	Transparency of polygons when several are plotted, defaults to 0.5.
border.col	Border colour(s) of polygon(s), defaults to black
strip.col	Strip background colour, defaults to "white"
strip.cex	Strip title character expansion
type	Plot type
cex	Character expansion for plotting symbol
pch	Plotting character
lwd	Specifies line width, defaults to 1
lty	Specifies line style, defaults to 1 (solid)
axes.lwd	Thickness of width of axes lines
xlab.label	The label for the x-axis
ylab.label	The label for the y-axis
xlab.cex	Size of x-axis label, defaults to 3
ylab.cex	Size of y-axis label, defaults to 3
xlab.col	Colour of the x-axis label, defaults to "black"
ylab.col	Colour of the y-axis label, defaults to "black"
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label
xlab.top.col	Colour of the top x-axis label
xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label

xlab.top.y	The y location of the top y-axis label
xaxis.lab	Vector listing x-axis tick labels, defaults to automatic
yaxis.lab	Vector listing y-axis tick labels, defaults to automatic
xaxis.cex	Size of x-axis scales, defaults to 2
yaxis.cex	Size of y-axis scales, defaults to 2
xaxis.rot	Rotation of x-axis tick labels; defaults to 0
yaxis.rot	Rotation of y-axis tick labels; defaults to 0
xaxis.log	Logical indicating whether x-variable should be in logarithmic scale (and what base if numeric)
yaxis.log	Logical indicating whether y-variable should be in logarithmic scale (and what base if numeric)
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales
xaxis.col	Colour of the x-axis tick labels, defaults to “black”
yaxis.col	Colour of the y-axis tick labels, defaults to “black”
xaxis.tck	Specifies the length of the tick marks for x-axis, defaults to 1
yaxis.tck	Specifies the length of the tick marks for y-axis, defaults to 1
xlimits	Two-element vector giving the x-axis limits
ylimits	Two-element vector giving the y-axis limits
xat	Vector listing where the x-axis labels should be drawn
yat	Vector listing where the y-axis labels should be drawn
layout	A vector specifying the number of columns, rows (e.g., c(2,1)). Default is NULL; see lattice::xyplot for more details
.	.
as.table	Specifies panel drawing order, default is FALSE which draws panels from bottom left corner, moving right then up. Set to TRUE to draw from top left corner, moving right then down
x.spacing	A number specifying the distance between panels along the x-axis, defaults to 0
y.spacing	A number specifying the distance between panels along the y-axis, defaults to 0
x.relation	Allows x-axis scales to vary if set to “free”, defaults to “same”
y.relation	Allows y-axis scales to vary if set to “free”, defaults to “same”
top.padding	A number specifying the distance to the top margin, defaults to 0.5
bottom.padding	A number specifying the distance to the bottom margin, defaults to 2
right.padding	A number specifying the distance to the right margin, defaults to 1
left.padding	A number specifying the distance to the left margin, defaults to 2
ylab.axis.padding	A number specifying the distance of ylabel to the y-axis, defaults to 0
,	,

add.border	Add xy border to polygon, default is FALSE
add.xy.border	DEPRECATED: Use 'add.border' argument instead
add.median	Add median line, default is FALSE
median.lty	Median line type
median.lwd	Median line width, defaults to 1.5
use.loess.border	Use loess curve for border instead of max/min values, default is FALSE
use.loess.median	Use loess curve for median values, default is FALSE
median	Median values for median line
median.col	Median line colour, default is black
extra.points	If not set to NULL (default), add a set of extra points to the plot. A list of two numeric vectors named "x" and "y" giving the co-ordinates of the points to be added
extra.points.pch	A vector specifying the types of extra points to add to the plot. Defaults to 21
extra.points.type	A vector specifying the plot type. Defaults to "p"
extra.points.col	A vector specifying the border colours of the extra points to add to the plot. Defaults to "black"
extra.points.fill	A vector specifying the fill colours of the extra points to add to the plot. Defaults to "white"
extra.points.cex	A vector specifying the sizes of the extra points to add to the plot. Defaults to 1
add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x coordinate of the rectangle to be drawn
ybottom.rectangle	Specifies the bottom y coordinate of the rectangle to be drawn
xright.rectangle	Specifies the right x coordinate of the rectangle to be drawn
ytop.rectangle	Specifies the top y coordinate of the rectangle to be drawn
col.rectangle	Specifies the colour to fill the rectangle's area
alpha.rectangle	Specifies the colour bias of the rectangle
xgrid.at	A vector listing the co-ordinates at which vertical grid-lines should be drawn. Default suppresses drawing of vertical grid-lines
ygrid.at	A vector listing the co-ordinates at which horizontal grid-lines should be drawn. Default suppresses drawing of horizontal grid-lines
grid.lty	Specifies the line type to use for the grid-lines. Defaults to 1 (solid lines)

grid.col	Specifies the colour to use for the grid-lines. Defaults to “grey”
grid.lwd	Specifies the width of the grid-lines. Defaults to 0.3
add.xyline	Allow y=x line to be drawn, default is FALSE
xyline.col	y=x line colour, defaults to black
xyline.lwd	Specifies y=x line width, defaults to 1
xyline.lty	Specifies y=x line style, defaults to 1 (solid)
abline.h	Allow horizontal line to be drawn, default to NULL
abline.v	Allow vertical line to be drawn, default to NULL
abline.col	Horizontal line colour, defaults to black
abline.lwd	Specifies horizontal line width, defaults to 1
abline.lty	Specifies horizontal line style, defaults to 1 (solid)
add.text	Allow additional text to be drawn, default is FALSE
text.labels	Labels for additional text
text.x	The x co-ordinates where additional text should be placed
text.y	The y co-ordinates where additional text should be placed
text.col	The colour of additional text
text.cex	The size of additional text
text.fontface	The fontface for additional text
key	Add a key to the plot. See xyplot.
legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See xyplot.
height	Figure height, defaults to 6 inches
width	Figure width, defaults to 6 inches
size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
description	Short description of image/plot; default NULL.
style	defaults to “BoutrosLab”, also accepts “Nature”, which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
inside.legend.auto	boolean specifying whether or not to use the automatic inside legend function

### Value

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

**Author(s)**

Denise Mak

### Arguments

x	A formula or a list of two numeric vectors
data	An optional data source if x is a formula
filename	Filename for tiff output, or if NULL returns the trellis object itself
aspect	This argument controls the physical aspect ratio of the panels, defaults to “fill”
prepanel	A function that takes the same arguments as the “panel”
add.grid	Default manner of drawing grid lines - for custom grids, use type = c('p','g') and set the xat, yat, xgrid.at, ygrid.at parameters
groups	The grouping variable in the data-frame
main	The main plot title
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
xlab.label	The label for the x-axis
ylab.label	The label for the y-axis
main.cex	Size of the overall plot title, defaults to 3
xlab.cex	Size of x-axis label, defaults to 2.5
ylab.cex	Size of y-axis label, defaults to 2.5
xlab.col	Colour of the x-axis label, defaults to “black”
ylab.col	Colour of the y-axis label, defaults to “black”
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label
xlab.top.col	Colour of the top x-axis label

xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label
xlab.top.y	The y location of the top y-axis label
xlimits	Two-element vector giving the x-axis limits, defaults to automatic
ylimits	Two-element vector giving the y-axis limits, defaults to automatic
xat	Vector listing where the x-axis labels should be drawn, defaults to automatic
yat	Vector listing where the y-axis labels should be drawn, defaults to automatic
xgrid.at	Vector listing where the x-axis grid lines should be drawn, defaults to xat
ygrid.at	Vector listing where the y-axis grid lines should be drawn, defaults to yat
xaxis.lab	Vector listing x-axis tick labels, defaults to automatic
yaxis.lab	Vector listing y-axis tick labels, defaults to automatic
xaxis.col	Colour of the x-axis tick labels, defaults to "black"
yaxis.col	Colour of the y-axis tick labels, defaults to "black"
xaxis.cex	Size of x-axis scales, defaults to 1.5
yaxis.cex	Size of y-axis scales, defaults to 1.5
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales
xaxis.log	Logical indicating whether x-variable should be in logarithmic scale (and what base if numeric)
yaxis.log	Logical indicating whether y-variable should be in logarithmic scale (and what base if numeric)
xaxis.rot	Counterclockwise rotation of text in x-axis scales in degrees, defaults to 0
yaxis.rot	Counterclockwise rotation of text in y-axis scales in degrees, defaults to 0
xaxis.tck	Specifies the length of the tick marks for x-axis, defaults to 1
yaxis.tck	Specifies the length of the tick marks for y-axis, defaults to 1
type	Plot type
cex	Character expansion for plotting symbol
pch	Plotting character
col	Point/line colour
lwd	Specifies line width, defaults to 1
lty	Specifies line style, defaults to 1 (solid)
axes.lwd	Thickness of width of axes lines
key	A list giving the key (legend). The default suppresses drawing
legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See xyplot.
top.padding	A number giving the top padding in multiples of the lattice default
bottom.padding	A number giving the bottom padding in multiples of the lattice default
left.padding	A number giving the left padding in multiples of the lattice default

<code>right.padding</code>	A number giving the right padding in multiples of the lattice default
<code>height</code>	Figure height, defaults to 6 inches
<code>width</code>	Figure width, defaults to 6 inches
<code>size.units</code>	Figure units, defaults to inches
<code>resolution</code>	Figure resolution in dpi, defaults to 1600
<code>enable.warnings</code>	Print warnings if set to TRUE, defaults to FALSE
<code>description</code>	Short description of image/plot; default NULL.
<code>add.rectangle</code>	Allow a rectangle to be drawn, default is FALSE
<code>xleft.rectangle</code>	Specifies the left x coordinate of the rectangle to be drawn
<code>ybottom.rectangle</code>	Specifies the bottom y coordinate of the rectangle to be drawn
<code>xright.rectangle</code>	Specifies the right x coordinate of the rectangle to be drawn
<code>ytop.rectangle</code>	Specifies the top y coordinate of the rectangle to be drawn
<code>col.rectangle</code>	Specifies the colour to fill the rectangle's area
<code>alpha.rectangle</code>	Specifies the colour bias of the rectangle to be drawn
<code>style</code>	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
<code>preload.default</code>	ability to set multiple sets of different defaults depending on publication needs
<code>use.legacy.settings</code>	boolean to set whether or not to use legacy mode settings (font)
<code>inside.legend.auto</code>	boolean specifying whether or not to use the automatic inside legend function

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Author(s)**

Ying Wu

### Arguments

x	A formula or a numeric vector
data	An optional data source if x is a formula
filename	Filename for tiff output, or if NULL returns the trellis object itself
groups	The grouping variable in the data-frame
confidence.bands	Add confidence bands or not, default to FALSE. Note that in this function, the confidence band can only be added to a single plot, not for multi-qq plot.
conf	Confidence level, default to 0.95
confidence.method	Methods used to draw confidence bands: “simultaneous”, “pointwise”, “both”, defaults to “both”.

reference.line.method	Methods used to draw reference line and must be one of “quartiles”(default), “diagonal”, “robust”. “quartiles” will draw a line across 1/4 and 3/4 quantiles, “diagonal” will draw a 0-1 line, “robust” will draw a best fit line basing on linear model. Note: for multi-panel plot, only the default one is applicable.
distribution	A quantile function that takes a vector of probabilities as argument and produces the corresponding quantiles from a theoretical distribution, defaults to “qnorm”, that is normal distribution.
aspect	This argument controls the physical aspect ratio of the panels, defaults to “fill”
prepanel	A function that takes the same arguments as the “panel”
main	The main plot title
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of the overall plot title, defaults to 3
xlab.label	x-axis title
ylab.label	y-axis title
xlab.cex	Size of x-axis label, defaults to 2.5
ylab.cex	Size of y-axis label, defaults to 2.5
xlab.col	Colour of the x-axis label, defaults to “black”
ylab.col	Colour of the y-axis label, defaults to “black”
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label
xlab.top.col	Colour of the top x-axis label
xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label
xlab.top.y	The y location of the top y-axis label
xlimits	Two-element vector giving the x-axis limits, defaults to automatic
ylimits	Two-element vector giving the y-axis limits, defaults to automatic
xat	Vector listing where the x-axis labels should be drawn, defaults to automatic
yat	Vector listing where the y-axis labels should be drawn, defaults to automatic
xaxis.lab	Vector listing x-axis tick labels, defaults to automatic
yaxis.lab	Vector listing y-axis tick labels, defaults to automatic
xaxis.cex	Size of x-axis scales, defaults to 1.5
yaxis.cex	Size of y-axis scales, defaults to 1.5
xaxis.col	Colour of the x-axis tick labels, defaults to “black”
yaxis.col	Colour of the y-axis tick labels, defaults to “black”
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales

<code>xaxis.log</code>	Logical indicating whether x-variable should be in logarithmic scale (and what base if numeric)
<code>yaxis.log</code>	Logical indicating whether y-variable should be in logarithmic scale (and what base if numeric)
<code>xaxis.rot</code>	Counterclockwise rotation of text in x-axis scales in degrees, defaults to 0
<code>yaxis.rot</code>	Counterclockwise rotation of text in y-axis scales in degrees, defaults to 0
<code>xaxis.tck</code>	Specifies the length of the tick marks for x-axis, defaults to 1
<code>yaxis.tck</code>	Specifies the length of the tick marks for y-axis, defaults to 1
<code>add.grid</code>	Default manner of drawing grid lines
<code>xgrid.at</code>	Vector listing where the x-axis grid lines should be drawn, defaults to <code>xat</code>
<code>ygrid.at</code>	Vector listing where the y-axis grid lines should be drawn, defaults to <code>yat</code>
<code>type</code>	Plot type
<code>cex</code>	Character expansion for plotting symbol
<code>pch</code>	Plotting character
<code>col</code>	Point colour
<code>col.line</code>	QQ line colour, defaults to grey
<code>lwd</code>	Specifies line width, defaults to 2
<code>lty</code>	Specifies line style, defaults to 1 (solid)
<code>axes.lwd</code>	Thickness of width of axes lines
<code>key</code>	A list giving the key (legend). The default suppresses drawing
<code>legend</code>	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See <code>xyplot</code> .
<code>add.rectangle</code>	Allow a rectangle to be drawn, default is FALSE
<code>xleft.rectangle</code>	Specifies the left x oordinate of the rectangle to be drawn
<code>ybottom.rectangle</code>	Specifies the bottom y coordinate of the rectangle to be drawn
<code>xright.rectangle</code>	Specifies the right x coordinate of the rectangle to be drawn
<code>ytop.rectangle</code>	Specifies the top y coordinate of the rectangle to be drawn
<code>col.rectangle</code>	Specifies the colour to fill the rectangle's area
<code>alpha.rectangle</code>	Specifies the colour bias of the rectangle to be drawn
<code>top.padding</code>	A number giving the top padding in multiples of the lattice default
<code>bottom.padding</code>	A number giving the bottom padding in multiples of the lattice default
<code>left.padding</code>	A number giving the left padding in multiples of the lattice default
<code>right.padding</code>	A number giving the right padding in multiples of the lattice default
<code>height</code>	Figure height, defaults to 6 inches
<code>width</code>	Figure width, defaults to 6 inches

size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
description	Short description of image/plot; default NULL.
style	defaults to “BoutrosLab”, also accepts “Nature”, which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
inside.legend.auto	boolean specifying whether or not to use the automatic inside legend function

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

Note that the confidence band only works for a single panel qq plot, not for grouped data and multi-qq plot. Why? What’s missing?

---

```
create.qqplot.fit.confidence.interval
```

*Create the confidence bands for a one-sample qq plot*

---

### Description

Returns the values of constructing the confidence bands for a one-sample qq plot

### Usage

```
create.qqplot.fit.confidence.interval(x, distribution = qnorm, conf = 0.95,  
conf.method = "both", reference.line.method = "quartiles");
```

### Arguments

x	A numeric vector
distribution	A quantile function that takes a vector of probabilities as argument and produces the corresponding quantiles from a theoretical distribution, defaults to "qnorm", that is normal distribution.
conf	Confidence level, default to 0.95
conf.method	Methods used to draw confidence bands and must be one of "simultaneous", "pointwise", "both"(default).
reference.line.method	Methods used to draw reference line and must be one of "quartiles"(default), "diagonal", "robust".

### Value

Returns the values of creating the upper and lower bands for the qq plot.

### Warning

Note that this function works only for a single panel qq plot, not for grouped data and multi-qq plot.

### Author(s)

Ying Wu

**Examples**

```

tmp.x <- rnorm(100);

tmp.confidence.interval <- create.qqplot.fit.confidence.interval(tmp.x);

qqnorm(tmp.x);
qqline(tmp.x);
lines(tmp.confidence.interval$z, tmp.confidence.interval$upper.pw, lty = 2, col = "brown");
lines(tmp.confidence.interval$z, tmp.confidence.interval$lower.pw, lty = 2, col = "brown");
lines(tmp.confidence.interval$z[tmp.confidence.interval$u],
      tmp.confidence.interval$upper.sim, lty = 2, col = "blue");
lines(tmp.confidence.interval$z[tmp.confidence.interval$l],
      tmp.confidence.interval$lower.sim, lty = 2, col = "blue");

legend(1, -1.5, c("simultaneous", "pointwise"), col = c("blue", "brown"), lty = 2, bty = "n");

```

---

create.scatterplot      *Make a scatterplot*

---

**Description**

Takes a data.frame and creates a scatterplot

**Usage**

```

create.scatterplot(
  formula,
  data,

### Arguments

formula	The formula used to extract the x & y components from the data-frame. Transforming data within formula is not compatible with automatic scaling with 'xat' or 'yat'.
data	The data-frame to plot
filename	Filename for tiff output, or if NULL returns the trellis object itself
groups	The grouping variable in the data-frame
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered

<code>main.x</code>	The x location of the main title, default is 0.5
<code>main.y</code>	The y location of the main title, default is 0.5
<code>main.cex</code>	Size of text for main plot title
<code>xlab.label</code>	x-axis label
<code>ylab.label</code>	y-axis label
<code>xlab.cex</code>	Size of x-axis label, defaults to 3
<code>ylab.cex</code>	Size of y-axis label, defaults to 3
<code>xlab.col</code>	Colour of the x-axis label, defaults to “black”
<code>ylab.col</code>	Colour of the y-axis label, defaults to “black”
<code>xlab.top.label</code>	The label for the top x-axis
<code>xlab.top.cex</code>	Size of top x-axis label
<code>xlab.top.col</code>	Colour of the top x-axis label
<code>xlab.top.just</code>	Justification of the top x-axis label, defaults to centered
<code>xlab.top.x</code>	The x location of the top x-axis label
<code>xlab.top.y</code>	The y location of the top y-axis label
<code>xlimits</code>	Two-element vector giving the x-axis limits, defaults to automatic
<code>ylimits</code>	Two-element vector giving the y-axis limits, defaults to automatic
<code>xat</code>	Accepts a vector listing where x-axis ticks should be drawn or if automatic scaling is desired, one of three strings: “auto”, “auto.linear” or “auto.log”. Automatic scaling fixes x-axis tick locations, labels, and data values dependent given data. “auto” will determine whether linear or logarithmic scaling fits the given data best, “auto.linear” or “auto.log” will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see ‘auto.axis()’.
<code>yat</code>	Accepts a vector listing where y-axis ticks should be drawn or if automatic scaling is desired, one of three strings: “auto”, “auto.linear” or “auto.log”. Automatic scaling fixes y-axis tick locations, labels, and data values dependent given data. “auto” will determine whether linear or logarithmic scaling fits the given data best, “auto.linear” or “auto.log” will force data to be scaled linearly or logarithmically respectively. Defaults to lattice automatic (TRUE). For more details see ‘auto.axis()’.
<code>xaxis.lab</code>	Vector listing x-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with xat will overwrite user input. Set to NULL to remove x-axis labels.
<code>yaxis.lab</code>	Vector listing y-axis tick labels, defaults to automatic (TRUE). Using automatic scaling with yat will overwrite user input. Set to NULL to remove y-axis labels.
<code>xaxis.log</code>	Logical indicating whether x-variable should be in logarithmic scale (and what base if numeric)
<code>yaxis.log</code>	Logical indicating whether y-variable should be in logarithmic scale (and what base if numeric)
<code>xaxis.cex</code>	Size of x-axis scales, defaults to 2
<code>yaxis.cex</code>	Size of y-axis scales, defaults to 2

<code>xaxis.rot</code>	Counterclockwise rotation of text in x-axis scales in degrees, defaults to 0
<code>yaxis.rot</code>	Counterclockwise rotation of text in y-axis scales in degrees, defaults to 0
<code>xaxis.fontface</code>	Fontface for the x-axis scales
<code>yaxis.fontface</code>	Fontface for the y-axis scales
<code>xaxis.col</code>	Colour of the x-axis tick labels, defaults to "black"
<code>yaxis.col</code>	Colour of the y-axis tick labels, defaults to "black"
<code>xaxis.tck</code>	Specifies the length of the tick mark, defaults to 1 for both top and bottom axes
<code>yaxis.tck</code>	Specifies the length of the tick mark, defaults to 1 for both top and bottom axes
<code>add.grid</code>	Logical stating wheter or not the grid should be drawn on the plot
<code>xgrid.at</code>	Vector listing where the x-axis grid lines should be drawn, defaults to <code>xat</code>
<code>ygrid.at</code>	Vector listing where the y-axis grid lines should be drawn, defaults to <code>yat</code>
<code>grid.colour</code>	ability to set individual grid line colours
<code>horizontal</code>	xyplot-specific function that allows you to change if <code>type='h'</code> draws lines to the vertical or horizontal axis
<code>type</code>	Accepts character vector of one or more elements defining how x and y are to be plotted. Accepted elements include: "p" to draw points, "l" to connect points with lines, "h" to draw vertical or horizontal line segments from the points to the origin, "s" or "S" to plot as a step curve, "g" to add a grid, and "r" to add a linear regression line. For more options and detail see "type" parameter in "xyplot" documentation.
<code>cex</code>	Character expansion for plotting symbol
<code>pch</code>	Plotting character
<code>col</code>	Point/line colour
<code>col.border</code>	Colour of border when points <code>pch &gt;= 21</code> . Defaults to "black"
<code>lwd</code>	Specifies line width, defaults to 1
<code>lty</code>	Specifies line style, defaults to 1 (solid)
<code>alpha</code>	Specifies line transparency, defaults to 1 (opaque)
<code>axes.lwd</code>	Thickness of width of axes lines
<code>strip.col</code>	Strip background colour, defaults to "white"
<code>strip.cex</code>	Strip title character expansion
<code>strip.fontface</code>	Strip title fontface, defaults to bold
<code>y.error.up</code>	upward error vector. Defaults to NULL. When <code>y.error.up</code> is NULL, vertical error bar is not drawn
<code>y.error.down</code>	Downward error vector. Defaults to <code>y.error.down</code> to show symmetric error bars
<code>x.error.right</code>	Rightward error vector. Defaults to NULL. When <code>x.error.right</code> is NULL, horizontal error bar is not drawn
<code>x.error.left</code>	Leftward error vector. Defaults to <code>x.error.right</code> to show symmetric error bars
<code>y.error.bar.col</code>	Colour of vertical error bar. Defaults to "black"

<code>x.error.bar.col</code>	Colour of horizontal error bar. Defaults to “black”
<code>error.whisker.angle</code>	Angle of the whisker drawn on error bar. Defaults to 90 degree
<code>error.bar.lwd</code>	Error bar line width. Defaults to 1
<code>error.bar.length</code>	Length of the error bar whiskers. Defaults to 0.1
<code>key</code>	A list giving the key (legend). The default suppresses drawing
<code>legend</code>	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See <code>xyplot</code> .
<code>top.padding</code>	A number specifying the distance to the top margin, defaults to 0.1
<code>bottom.padding</code>	A number specifying the distance to the bottom margin, defaults to 0.7
<code>right.padding</code>	A number specifying the distance to the right margin, defaults to 0.1
<code>left.padding</code>	A number specifying the distance to the left margin, defaults to 0.5
<code>key.top</code>	A number specifying the distance at top of key, defaults to 0.1
<code>key.left.padding</code>	Amount of padding to go onto any legend on the left
<code>ylab.axis.padding</code>	A number specifying the distance of ylabel to the y-axis, defaults to 1
<code>axis.key.padding</code>	A number specifying the distance from the y-axis to the key, defaults to 1
<code>layout</code>	A vector specifying the number of columns, rows (e.g., <code>c(2,1)</code> ). Default is <code>NULL</code> ; see <code>lattice::xyplot</code> for more details
<code>as.table</code>	Specifies panel drawing order, default is <code>FALSE</code> which draws panels from bottom left corner, moving right then up. Set to <code>TRUE</code> to draw from top left corner, moving right then down
<code>x.spacing</code>	A number specifying the distance between panels along the x-axis, defaults to 0
<code>y.spacing</code>	A number specifying the distance between panels along the y-axis, defaults to 0
<code>x.relation</code>	Allows x-axis scales to vary if set to “free”, defaults to “same”
<code>y.relation</code>	Allows y-axis scales to vary if set to “free”, defaults to “same”
<code>add.axes</code>	Allow axis lines to be turned on or off, default is <code>FALSE</code>
<code>axes.lty</code>	Specifies axis line style, defaults to “dashed”
<code>add.xyline</code>	Allow $y=x$ line to be drawn, default is <code>FALSE</code>
<code>xyline.col</code>	$y=x$ line colour, defaults to black
<code>xyline.lwd</code>	Specifies $y=x$ line width, defaults to 1
<code>xyline.lty</code>	Specifies $y=x$ line style, defaults to 1 (solid)
<code>abline.h</code>	Allow horizontal line to be drawn, default to <code>NULL</code>
<code>abline.v</code>	Allow vertical line to be drawn, default to <code>NULL</code>
<code>abline.col</code>	Horizontal line colour, defaults to black
<code>abline.lwd</code>	Specifies horizontal line width, defaults to 1

<code>abline.lty</code>	Specifies horizontal line style, defaults to 1 (solid)
<code>add.curves</code>	Allow curves to drawn, default is FALSE
<code>curves.exprs</code>	A list of functions, expressions, or calls using “x” as a variable that specify the curves to be drawn
<code>curves.from</code>	Specifies the x co-ordinates at which the start of each curve should be drawn, defaults to drawing the curves to the left edge of the plotting region
<code>curves.to</code>	Specifies the x co-ordinates at which the end of each curve should be drawn, defaults to drawing the curves to the right edge of the plotting region
<code>curves.col</code>	Specifies colours of curves, default is black for each curve
<code>curves.lwd</code>	Specifies width of curves, default is 1 for each curve
<code>curves.lty</code>	Specifies type of curves, default is 1 (solid) for each curve
<code>add.rectangle</code>	Allow a rectangle to be drawn, default is FALSE
<code>xleft.rectangle</code>	Specifies the left x oordinate of the rectangle to be drawn
<code>ybottom.rectangle</code>	Specifies the bottom y coordinate of the rectangle to be drawn
<code>xright.rectangle</code>	Specifies the right x coordinate of the rectangle to be drawn
<code>ytop.rectangle</code>	Specifies the top y coordinate of the rectangle to be drawn
<code>col.rectangle</code>	Specifies the colour to fill rectangle’s area
<code>alpha.rectangle</code>	Specifies the colour bias of the rectangle to be drawn
<code>add.points</code>	Allow additional points to be drawn, default is FALSE
<code>points.x</code>	The x co-ordinates where additional points should be drawn
<code>points.y</code>	The y co-ordinates where additional points should be drawn
<code>points.pch</code>	The plotting character for additional points
<code>points.col</code>	The colour of additional points
<code>points.col.border</code>	Colour of the border of additional points if <code>points.pch &gt;= 21</code> . Defaults to black
<code>points.cex</code>	The size of additional points
<code>add.line.segments</code>	Allow additional line segments to be drawn, default is FALSE
<code>line.start</code>	The y co-ordinates where additional line segments should start
<code>line.end</code>	The y co-ordinates where additional line segments should end
<code>line.col</code>	The colour of additional line segments, default is black
<code>line.lwd</code>	The line width of additional line segments, default is 1
<code>add.text</code>	Allow additional text to be drawn, default is FALSE
<code>text.labels</code>	Labels for additional text
<code>text.x</code>	The x co-ordinates where additional text should be placed
<code>text.y</code>	The y co-ordinates where additional text should be placed

<code>text.col</code>	The colour of additional text
<code>text.cex</code>	The size of additional text
<code>text.fontface</code>	The fontface for additional text
<code>text.guess.labels</code>	Allows automatic labeling by considering values in <code>text.x</code> and <code>text.y</code> as a data point to be labelled, default is FALSE
<code>text.guess.skip.labels</code>	Provides an option to disregard automatic labelling algorithm if no space is available around a data point, thus forcing labelling if a collision is likely, default is TRUE
<code>text.guess.ignore.radius</code>	Allows the automatic labeling algorithm to ignore the radius space of a data point, useful to label a cluster of data points with a single text box, default is FALSE
<code>text.guess.ignore.rectangle</code>	Allows the automatic labeling algorithm to ignore the rectangle space of multiple potential label positions, default is FALSE
<code>text.guess.radius.factor</code>	A numeric value to factor the radius value to alter distance from the label and the data point
<code>text.guess.buffer.factor</code>	A numeric value to factor the buffer value to alter the space which is used to consider if data points are potentially going to collide
<code>text.guess.label.position</code>	A numeric value between 0 and 360 to specify the precise angle of a text box center and the positive x-axis. Angles move counter-clockwise beginning at the positive x axis
<code>height</code>	Figure height, defaults to 6 inches
<code>width</code>	Figure width, defaults to 6 inches
<code>size.units</code>	Figure units, defaults to inches
<code>resolution</code>	Figure resolution in dpi, defaults to 1600
<code>enable.warnings</code>	Print warnings if set to TRUE, defaults to FALSE
<code>description</code>	Short description of image/plot; default NULL
<code>style</code>	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
<code>preload.default</code>	ability to set multiple sets of different defaults depending on publication needs
<code>group.specific.colouring</code>	Variable to specify if group specific multi colouring for error bars is enforced
<code>use.legacy.settings</code>	boolean to set whether or not to use legacy mode settings (font)
<code>inside.legend.auto</code>	boolean specifying whether or not to use the automatic inside legend function

```

regions.labels Labels for each of the regions on the lollipop plots bars
regions.start  start x value of each of the regions
regions.stop   stop value for each of the regions
regions.color  color of each of the regions
regions.cex    size of the text of each of the regions
regions.alpha  alpha of each of the regions
lollipop.bar.y y location of top of the lollipop plot bar – defaults to right above the bottom y
               axis
lollipop.bar.color
               color of the lollipop plot bar
...           Additional arguments to be passed to xyplot

```

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```

Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics

```

**Author(s)**

```

### Arguments

formula	The formula used to extract the x & y components from the data-frame
data	The data-frame to plot
filename	Filename for tiff output, or if NULL returns the trellis object itself
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title, defaults to 3
xlab.label	x-axis label
ylab.label	y-axis label
xlab.cex	Size of x-axis label, defaults to 2
ylab.cex	Size of y-axis label, defaults to 2
xlab.col	Colour of the x-axis label, defaults to "black"

<code>ylab.col</code>	Colour of the y-axis label, defaults to “black”
<code>xlab.top.label</code>	The label for the top x-axis
<code>xlab.top.cex</code>	Size of top x-axis label
<code>xlab.top.col</code>	Colour of the top x-axis label
<code>xlab.top.just</code>	Justification of the top x-axis label, defaults to centered
<code>xlab.top.x</code>	The x location of the top x-axis label
<code>xlab.top.y</code>	The y location of the top y-axis label
<code>xaxis.lab</code>	Vector listing x-axis tick labels, defaults to automatic
<code>yaxis.lab</code>	Vector listing y-axis tick labels, defaults to automatic
<code>xaxis.cex</code>	Size of x-axis scales, defaults to 1.5
<code>yaxis.cex</code>	Size of y-axis scales, defaults to 1.5
<code>xaxis.col</code>	Colour of the x-axis tick labels, defaults to “black”
<code>yaxis.col</code>	Colour of the y-axis tick labels, defaults to “black”
<code>xaxis.fontface</code>	Fontface for the x-axis scales, defaults to “plain”
<code>yaxis.fontface</code>	Fontface for the y-axis scales, defaults to “plain”
<code>xaxis.rot</code>	Counterclockwise rotation of text in x-axis scales in degrees, defaults to 0
<code>yaxis.rot</code>	Counterclockwise rotation of text in y-axis scales in degrees, defaults to 0
<code>xaxis.tck</code>	Specifies the length of the tick mark, defaults to 1 for both top and bottom axes
<code>yaxis.tck</code>	Specifies the length of the tick mark, defaults to 1 for both top and bottom axes
<code>xlimits</code>	Two-element vector giving the x-axis limits, defaults to automatic
<code>ylimits</code>	Two-element vector giving the y-axis limits, defaults to automatic
<code>xat</code>	Vector listing where the x-axis labels should be drawn, defaults to automatic
<code>yat</code>	Vector listing where the y-axis labels should be drawn, defaults to automatic
<code>abline.h</code>	Allow horizontal line to be drawn, default to NULL
<code>abline.v</code>	Allow vertical line to be drawn, default to NULL
<code>abline.lty</code>	Specifies horizontal line style, defaults to 1 (solid)
<code>abline.lwd</code>	Specifies horizontal line width, defaults to 1
<code>abline.col</code>	Horizontal line colour, defaults to black
<code>segments.col</code>	Colour of segments, defaults to “black”
<code>segments.lwd</code>	Line width of segments, defaults to 1
<code>layout</code>	A vector specifying the number of columns, rows (e.g., <code>c(2,1)</code> ). Default is NULL; see <code>lattice::xyplot</code> for more details
<code>as.table</code>	Specifies panel drawing order, default is FALSE which draws panels from bottom left corner, moving right then up. Set to TRUE to draw from top left corner, moving right then down
<code>x.spacing</code>	A number specifying the distance between panels along the x-axis, defaults to 0
<code>y.spacing</code>	A number specifying the distance between panels along the y-axis, defaults to 0
<code>x.relation</code>	Allows x-axis scales to vary if set to “free”, defaults to “same”

y.relation	Allows y-axis scales to vary if set to “free”, defaults to “same”
top.padding	A number specifying the distance to the top margin, defaults to 0.1
bottom.padding	A number specifying the distance to the bottom margin, defaults to 0.7
right.padding	A number specifying the distance to the right margin, defaults to 0.1
left.padding	A number specifying the distance to the left margin, defaults to 0.5
ylab.axis.padding	A number specifying the distance of ylabel to the y-axis, defaults to 1
,	
level	Optional covariate that determines colour coding of the segments, if specified overwrites segments.col, can contain actual colors or values to determine colors, then col.regions should be defined
col.regions	Vector of colors, define if level is numeric
centers	Optional vector for centers of segments, defaults to NULL
plot.horizontal	Logical whether segments should be drawn horizontally (default) or vertically
draw.bands	Logical to specify whether to draw lines (default) or rectangles
pch	Plotting character for centers
symbol.col	Colour of plotting character for centers, defaults to “black”
symbol.cex	Size of plotting character for centers, defaults to 1
add.rectangle	Allow a rectangle to be drawn, default is FALSE
xleft.rectangle	Specifies the left x coordinate of the rectangle to be drawn
ybottom.rectangle	Specifies the bottom y coordinate of the rectangle to be drawn
xright.rectangle	Specifies the right x coordinate of the rectangle to be drawn
yttop.rectangle	Specifies the top y coordinate of the rectangle to be drawn
col.rectangle	Specifies the colour to fill the rectangle’s area
alpha.rectangle	Specifies the colour bias of the rectangle to be drawn
axes.lwd	Specifies axes line width, defaults to 1
key	A list giving the key (legend). The default suppresses drawing
legend	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See xyplot.
height	Figure height, defaults to 6 inches
width	Figure width, defaults to 6 inches
size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE

**description** Short description of image/plot; default NULL  
**style** defaults to “BoutrosLab”, also accepts “Nature”, which changes parameters according to Nature formatting requirements  
**preload.default** ability to set multiple sets of different defaults depending on publication needs  
**use.legacy.settings** boolean to set whether or not to use legacy mode settings (font)  
**inside.legend.auto** boolean specifying whether or not to use the automatic inside legend function  
**disable.factor.sorting** Disable barplot auto sorting factors alphabetically/numerically

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

**Author(s)**

create.stripplot

*Make a strip-plot*

---

### Description

Takes a formula and a data.frame and creates a strip-plot

**Usage**

```
create.stripplot(  
  formula,  
  data,  
  filename = NULL,  
  groups = NULL,  
  jitter.data = FALSE,  
  jitter.factor = 1,  
  jitter.amount = NULL,  
  main = NULL,  
  main.just = 'center',  
  main.x = 0.5,  
  main.y = 0.5,  
  main.cex = 3,  
  xlab.label = tail(sub('~', '', formula[-2]), 1),  
  ylab.label = tail(sub('~', '', formula[-3]), 1),  
  xlab.cex = 2,  
  ylab.cex = 2,  
  xlab.col = 'black',  
  ylab.col = 'black',  
  xlab.top.label = NULL,  
  xlab.top.cex = 2,  
  xlab.top.col = 'black',  
  xlab.top.just = 'center',  
  xlab.top.x = 0.5,  
  xlab.top.y = 0,  
  xaxis.lab = TRUE,  
  yaxis.lab = TRUE,  
  xaxis.cex = 1.5,  
  yaxis.cex = 1.5,  
  xaxis.col = 'black',  
  yaxis.col = 'black',  
  xaxis.fontface = 'bold',  
  yaxis.fontface = 'bold',  
  xaxis.rot = 0,  
  yaxis.rot = 0,  
  xaxis.tck = 0,  
  yaxis.tck = 1,  
  xlimits = NULL,  
  ylimits = NULL,

)

```

### Arguments

<code>formula</code>	The formula used to extract the x & y components from the data-frame
<code>data</code>	The data-frame to plot
<code>filename</code>	Filename for tiff output, or if NULL returns the trellis object itself
<code>groups</code>	The grouping variable in the data-frame
<code>jitter.data</code>	Allow data to be staggered, default is FALSE
<code>jitter.factor</code>	Numeric value to apply to jitter, default is 1
<code>jitter.amount</code>	Numeric; amount of noise to add, default is NULL

main	The main title for the plot (space is reclaimed if NULL)
s	
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title
xlab.label	X-axis label
ylab.label	Y-axis label
xlab.cex	Size of x-axis label, defaults to 3
ylab.cex	Size of y-axis label, defaults to 3
xlab.col	Colour of the x-axis label, defaults to "black"
ylab.col	Colour of the y-axis label, defaults to "black"
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label
xlab.top.col	Colour of the top x-axis label
xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label
xlab.top.y	The y location of the top y-axis label
xaxis.lab	Vector listing x-axis tick labels, defaults to automatic
yaxis.lab	Vector listing y-axis tick labels, defaults to automatic
xaxis.cex	Size of x-axis scales, defaults to 2
yaxis.cex	Size of y-axis scales, defaults to 2
xaxis.col	Colour of the x-axis tick labels, defaults to "black"
yaxis.col	Colour of the y-axis tick labels, defaults to "black"
xaxis.fontface	Fontface for the x-axis scales
yaxis.fontface	Fontface for the y-axis scales
xaxis.rot	Rotation of x-axis tick labels; defaults to 0
yaxis.rot	Rotation of y-axis tick labels; defaults to 0
xaxis.tck	Specifies the length of the tick marks for x-axis, defaults to 0
yaxis.tck	Specifies the length of the tick marks for y-axis, defaults to 1
xlimits	Two-element vector giving the x-axis limits, default is automatic
ylimits	Two-element vector giving the y-axis limits, default is automatic
xat	Vector listing where the x-axis labels should be drawn, default is automatic
yat	Vector listing where the y-axis labels should be drawn, default is automatic
lwd	Line width, defaults to 1
pch	The plotting character (defaults to filled circles)
col	Colour of the plotting character (defaults to black)

<code>col.border</code>	Colour of border when <code>pch &gt; 21</code> . Defaults to black
<code>fill</code>	Fill colour of the plotting character if <code>pch</code> set to 21:25 (defaults to transparent)
<code>colour.alpha</code>	Bias to be added to colour selection (defaults to 1)
<code>cex</code>	The size of the plotting character
<code>top.padding</code>	A number specifying the distance to the top margin, defaults to 0.1
<code>bottom.padding</code>	A number specifying the distance to the bottom margin, defaults to 0.7
<code>right.padding</code>	A number specifying the distance to the right margin, defaults to 0.3
<code>left.padding</code>	A number specifying the distance to the left margin, defaults to 0.5
<code>ylab.axis.padding</code>	A number specifying the distance of ylabel to the y-axis, defaults to 1
<code>layout</code>	A vector specifying the number of columns, rows (e.g., <code>c(2,1)</code> ). Default is <code>NULL</code> ; see <code>lattice::xyplot</code> for more details
.	
<code>as.table</code>	Specifies panel drawing order, default is <code>TRUE</code> to draw from top left corner, moving right then down. Set to <code>FALSE</code> to draw panels from bottom left corner, moving right then up
<code>x.spacing</code>	A number specifying the distance between panels along the x-axis, defaults to 0
<code>y.spacing</code>	A number specifying the distance between panels along the y-axis, defaults to 0
<code>add.median</code>	<code>TRUE/FALSE</code> indicating whether lines should be drawn at the group medians, default is <code>FALSE</code>
<code>median.values</code>	A vector of values representing the median of each group, default is <code>NULL</code>
<code>add.rectangle</code>	Allow a rectangle to be drawn, default is <code>FALSE</code>
<code>xleft.rectangle</code>	Specifies the left x coordinate of the rectangle to be drawn
<code>ybottom.rectangle</code>	Specifies the bottom y coordinate of the rectangle to be drawn
<code>xright.rectangle</code>	Specifies the right x coordinate of the rectangle to be drawn
<code>ytop.rectangle</code>	Specifies the top y coordinate of the rectangle to be drawn
<code>col.rectangle</code>	Specifies the colour to fill the rectangle's area
<code>alpha.rectangle</code>	Specifies the colour bias of the rectangle to be drawn
<code>strip.col</code>	Strip background colour, defaults to "white"
<code>strip.cex</code>	Strip title character expansion
<code>strip.fontface</code>	Strip text fontface, defaults to bold
<code>key</code>	A list giving the key (legend). The default suppresses drawing
<code>legend</code>	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See <code>xyplot</code> .
<code>height</code>	Figure height, defaults to 6 inches

width	Figure width, defaults to 6 inches
size.units	Figure units, defaults to inches
resolution	Figure resolution in dpi, defaults to 1600
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
description	Short description of image/plot; default NULL
style	defaults to “BoutrosLab”, also accepts “Nature”, which changes parameters according to Nature formatting requirements
preload.default	ability to set multiple sets of different defaults depending on publication needs
use.legacy.settings	boolean to set whether or not to use legacy mode settings (font)
inside.legend.auto	boolean specifying whether or not to use the automatic inside legend function
disable.factor.sorting	Disable barplot auto sorting factors alphabetically/numerically

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

**Author(s)**

Paul C. Boutros

**See Also**

strip.fontface = 'bold',
layout = NULL
)

```

### Arguments

formula	The formula used to extract the violin components from the data-frame
data	The data-frame to plot
filename	Filename for tiff output, or if NULL returns the trellis object itself
main	The main title for the plot (space is reclaimed if NULL)
main.just	The justification of the main title for the plot, default is centered
main.x	The x location of the main title, default is 0.5
main.y	The y location of the main title, default is 0.5
main.cex	Size of text for main plot title, defaults to 3
xlab.label	The label for the x-axis
ylab.label	The label for the y-axis
xlab.cex	Size of x-axis label, defaults to 3
ylab.cex	Size of y-axis label, defaults to 3
xlab.col	Colour of the x-axis label, defaults to "black"
ylab.col	Colour of the y-axis label, defaults to "black"
xlab.top.label	The label for the top x-axis
xlab.top.cex	Size of top x-axis label
xlab.top.col	Colour of the top x-axis label
xlab.top.just	Justification of the top x-axis label, defaults to centered
xlab.top.x	The x location of the top x-axis label
xlab.top.y	The y location of the top y-axis label
xaxis.lab	Vector listing x-axis tick labels, defaults to automatic
yaxis.lab	Vector listing y-axis tick labels, defaults to automatic
xaxis.cex	Size of x-axis tick labels, defaults to 2
yaxis.cex	Size of y-axis tick labels, defaults to 2

<code>xaxis.col</code>	Colour of the x-axis tick labels, defaults to “black”
<code>yaxis.col</code>	Colour of the y-axis tick labels, defaults to “black”
<code>xaxis.fontface</code>	Fontface for the x-axis scales
<code>yaxis.fontface</code>	Fontface for the y-axis scales
<code>xaxis.rot</code>	Rotation of x-axis tick labels; defaults to 0
<code>yaxis.rot</code>	Rotation of y-axis tick labels; defaults to 0
<code>xaxis.tck</code>	Specifies the length of the tick marks for x-axis, defaults to <code>c(1,0)</code>
<code>yaxis.tck</code>	Specifies the length of the tick marks for y-axis, defaults to <code>c(1,1)</code>
<code>xlimits</code>	Two-element vector giving the x-axis limits, default is automatic
<code>xat</code>	Vector listing where the x-axis labels should be drawn, default is automatic
<code>ylimits</code>	Two-element vector giving the y-axis limits, default is automatic
<code>yat</code>	Vector listing where the y-axis labels should be drawn, default is automatic
<code>col</code>	Colour to use for filling the interior of the violin plots, defaults to “black”
<code>lwd</code>	Line width, defaults to 1
<code>border.lwd</code>	Width of the exterior boundary of the violin plots, defaults to 1
<code>bandwidth</code>	Smoothing bandwidth, or character string giving rule to choose bandwidth ( <code>'nrd0'</code> , <code>'nrd'</code> , <code>'ucv'</code> , <code>'bcv'</code> , <code>'sj'</code> , or <code>'sj-ste'</code> ). Passed to base R function <code>density</code> , via <code>lattice::bwplot</code> .
<code>bandwidth.adjust</code>	Adjustment parameter for the bandwidth (bandwidth used is <code>bandwidth*bandwidth.adjust</code> ). Makes it easy to specify bandwidth as a proportion of the default.
<code>extra.points</code>	A list of numeric vectors, each one of length equal to the number of violins to be plotted. Specifies a set or sets of extra points to be plotted along the vertical spine of each violin plot. Defaults to NULL (no points to be added)
<code>extra.points.pch</code>	A vector of the same length as <code>extra.points</code> specifying the symbol to use for each set of points. Defaults to 21
<code>extra.points.col</code>	A vector of the same length as <code>extra.points</code> specifying the colour to use for each set of points. Defaults to “white”
<code>extra.points.border</code>	A vector of the same length as <code>extra.points</code> specifying the border colour to use for points $\geq 21$ . Defaults to “black”
<code>extra.points.cex</code>	A vector of the same length as <code>extra.points</code> specifying the size of each set of points. Defaults to 1
<code>start</code>	Start of boundary cutoff, default is NULL for no boundary
<code>end</code>	End of boundary cutoff, default is NULL for no boundary
<code>scale</code>	Logical; Scales the violin plots, see <code>?panel.violin</code> for more details, default is FALSE

<code>plot.horizontal</code>	Logical; Determines whether to draw violin plot horizontally or vertically; default is FALSE; If <code>horizontal</code> is FALSE, <code>x</code> will be coerced to a factor or shingle, and vice versa.
<code>top.padding</code>	A number giving the top padding in multiples of the lattice default
<code>bottom.padding</code>	A number giving the bottom padding in multiples of the lattice default
<code>left.padding</code>	A number giving the left padding in multiples of the lattice default
<code>right.padding</code>	A number giving the right padding in multiples of the lattice default
<code>key</code>	Add a key to the plot. See <code>xyplot</code> .
<code>legend</code>	Add a legend to the plot. Helpful for adding multiple keys and adding keys to the margins of the plot. See <code>xyplot</code> .
<code>add.rectangle</code>	Allow a rectangle to be drawn, default is FALSE
<code>xleft.rectangle</code>	Specifies the left x coordinate of the rectangle to be drawn
<code>ybottom.rectangle</code>	Specifies the bottom y coordinate of the rectangle to be drawn
<code>xright.rectangle</code>	Specifies the right x coordinate of the rectangle to be drawn
<code>ytop.rectangle</code>	Specifies the top y coordinate of the rectangle to be drawn
<code>col.rectangle</code>	Specifies the colour to fill the rectangle's area
<code>alpha.rectangle</code>	Specifies the colour bias of the rectangle to be drawn
<code>height</code>	Figure height, defaults to 6 inches
<code>width</code>	Figure width, defaults to 6 inches
<code>resolution</code>	Figure resolution in dpi, defaults to 1600
<code>size.units</code>	Figure units, defaults to inches
<code>enable.warnings</code>	Print warnings if set to TRUE, defaults to FALSE
<code>description</code>	Short description of image/plot; default NULL
<code>style</code>	defaults to "BoutrosLab", also accepts "Nature", which changes parameters according to Nature formatting requirements
<code>preload.default</code>	ability to set multiple sets of different defaults depending on publication needs
<code>use.legacy.settings</code>	boolean to set whether or not to use legacy mode settings (font)
<code>disable.factor.sorting</code>	Disable barplot auto sorting factors alphabetically/numerically
<code>strip.col</code>	Strip background colour, defaults to "white"
<code>strip.cex</code>	Size of text in Strip titles
<code>strip.fontface</code>	Strip title fontface, defaults to bold. 1 = plain, 2 = bold, 3 = italics, 4 = bold and italics
<code>layout</code>	A vector specifying the number of columns, rows (e.g., <code>c(2,1)</code> ).

**Value**

If filename is NULL then returns the trellis object, otherwise creates a plot and returns a 0/1 success code.

**Warning**

If this function is called without capturing the return value, or specifying a filename, it may crash while trying to draw the histogram. In particular, if a script that uses such a call of create histogram is called by reading the script in from the command line, it will fail badly, with an error message about unavailable fonts:

```
Error in grid.Call.graphics("L_text", as.graphicsAnnot(x$label), x$x, )
  Invalid font type
Calls: print ... drawDetails.text -> grid.Call.graphics -> .Call.graphics
```

**Author(s)**

---

```
critical.value.ks.test
```

*Critical Value for Kolmogorov-Smirnov Test*

---

### Description

Takes a sample size and a confidence level and computes the corresponding critical value basing on the kolmogorov-smirnov test

### Usage

```
critical.value.ks.test(n, conf, alternative = "two.sided");
```

### Arguments

n	The sample size
conf	The confidence level
alternative	Indicates the alternative hypothesis and must be one of "two.sided"(default), "one-sided".

### Value

The corresponding critical value

### Author(s)

Ying Wu

### Examples

```
critical.value.ks.test(10, 0.95);  
critical.value.ks.test(100, 0.95, alternative = "one-sided");
```

---

default.colours	<i>Provides default colour schemes.</i>
-----------------	---

---

### Description

Returns colour schemes based on user input. Used to provide default colour schemes for simple cases.

### Usage

```
default.colours(  
  number.of.colours = 2,  
  palette.type = 'qual',  
  is.greyscale = TRUE,  
  is.venn = FALSE  
);
```

### Arguments

number.of.colours	The number of colours requested for the colour scheme.
palette.type	The type of colour scheme requested. Only palette types of “seq”, “div”, “qual”, “pastel”, “survival”, “dotmap”, “spiral.sunrise”, “spiral.morning”, “spiral.dusk”, “spiral.noon”, “spiral.afternoon”, “spiral.dawn”, and “spiral.night” are accepted. Legacy colour palettes are available under “chromosomes”, “old.qual1”, “old.qual2”, “old.seq”, and “old.div”. “seq” corresponds to sequential colour schemes, “div” corresponds to diverging colour schemes, and “qual” corresponds to qualitative colour schemes - “pastel” is a pastel version of this palette. “survival” is useful for survival plots, as the first two colour are blue and red, following convention. The remaining colour schemes are not tied to a specific use-case.
is.greyscale	Boolean asking whether or the colour scheme should be greyscale-compatible. Defaults to TRUE. The purpose of this parameter is to warn users if they ask for a colour scheme that is not greyscale-compatible. Regardless of the value of is.greyscale, the same colour scheme will be provided.
is.venn	Boolean determining whether or not the colour scheme is to be used for a venn diagram. If TRUE, the palette type should be set to NULL. For venn diagrams, text colours are also provided.

### Details

For further information on colour schemes, refer to the plotting guide.)

### Author(s)

Christine P’ng

**Examples**

```

default.colours(number.of.colours = 6, is.greyscale = FALSE, palette.type = 'div')
# Returns:
# [1] "#B32B2B" "#DD4E4E" "#EB7C7C" "#F7BEBE" "#BEF4F7" "#80CDD1"

default.colours(number.of.colours = 3, palette.type = NULL, is.venn = TRUE)
# Returns:
# [1] "red"          "dodgerblue"  "yellow"
# [1] "darkred"      "darkblue"    "darkorange"
# The second line of colours is the corresponding text colour

default.colours(number.of.colours = c('2','5','3'), c('binary','seq','seq'))
# Returns:
# [[1]]
# [1] "white"        "chartreuse3"

# [[2]]
# [1] "lavenderblush" "pink"        "palevioletred1" "violetred1"
# [5] "maroon"

# [[3]]
# [1] "aliceblue"    "lightblue1"  "lightskyblue"

default.colours(5, 'spiral.sunrise');
# Returns:
# [1] "#336A90" "#65B4A2" "#B1D39A" "#F4E0A6" "#FFE1EE"

```

---

display.colours      *Function to display R colors, as well as corresponding R grey colours.*

---

**Description**

Displays R colors and their corresponding R grey colours.

**Usage**

```

display.colours(
  cols,
  names = cols
);

```

**Arguments**

cols                    Vector of colours to be displayed.  
names                    The names of the colours. Defaults to equal the input of cols

**Details**

For further information on colour schemes, refer to the colour guide (in Resources/general)

**Author(s)**

Christine P'ng

**Examples**

```
display.colours('red');
# Red and Grey are displayed

display.colours(default.colours(5));
# Five default colours and their grey values are displayed

test.colours <- force.colour.scheme(c('skin','nerve'), 'tissue');
display.colours(test.colours);
```

---

display.statistical.result

*Utility function to display statistical result in a plot*

---

**Description**

A utility function to display statistical result in a plot in scientific notation (when appropriate)

**Usage**

```
display.statistical.result(
  x,
  lower.cutoff = 2.2e-50,
  scientific.cutoff = 0.001,
  digits = 2,
  statistic.type = 'P',
  symbol = ': '
);
```

**Arguments**

x	Numeric value to be displayed
lower.cutoff	For values of x smaller than lower.cutoff, the return value will be "< lower.cutoff". Defaults to 2.2e-16
scientific.cutoff	For values of x larger or equal to scientific.cutoff, standard notation will be used (rather than scientific notation). Defaults to 0.001
digits	Number of decimal places of precision to be shown
statistic.type	Type of statistic to be displayed, defaults to "P".
symbol	Symbol prior to statistic to be displayed, defaults to ": "

## Details

Available distance measures are (written for two vectors  $x$  and  $y$ ):

**euclidean:** Usual square distance between the two vectors (2 norm).

**maximum:** Maximum distance between two components of  $x$  and  $y$  (supremum norm)

**manhattan:** Absolute distance between the two vectors (1 norm).

**canberra:**  $\sum_i |x_i - y_i| / |x_i + y_i|$ . Terms with zero numerator and denominator are omitted from the sum and treated as if the values were missing.

This is intended for non-negative values (e.g. counts): taking the absolute value of the denominator is a 1998 R modification to avoid negative distances.

**binary:** (aka *asymmetric binary*): The vectors are regarded as binary bits, so non-zero elements are 'on' and zero elements are 'off'. The distance is the *proportion* of bits in which only one is on amongst those in which at least one is on.

**minkowski:** The  $p$  norm, the  $p$ th root of the sum of the  $p$ th powers of the differences of the components.

**jaccard:** The proportion of items that are not in both sets. For binary data, the output is equal to `dist(method="binary")`

Missing values are allowed, and are excluded from all computations involving the rows within which they occur. Further, when Inf values are involved, all pairs of values are excluded when their contribution to the distance gave NaN or NA. If some columns are excluded in calculating a Euclidean, Manhattan, Canberra or Minkowski distance, the sum is scaled up proportionally to the number of columns used. If all pairs are excluded when calculating a particular distance, the value is NA.

The "dist" method of `as.matrix()` and `as.dist()` can be used for conversion between objects of class "dist" and conventional distance matrices.

## Value

`dist` returns an object of class "dist".

The lower triangle of the distance matrix stored by columns in a vector, say `do`. If  $n$  is the number of observations, i.e.,  $n \leftarrow \text{attr}(do, "Size")$ , then for  $i < j \leq n$ , the dissimilarity between (row)  $i$  and  $j$  is `do[n*(i-1) - i*(i-1)/2 + j-i]`. The length of the vector is  $n * (n - 1) / 2$ , i.e., of order  $n^2$ .

The object has the following attributes (besides "class" equal to "dist"):

Size	integer, the number of observations in the dataset.
Labels	optionally, contains the labels, if any, of the observations of the dataset.
Diag, Upper	logicals corresponding to the arguments <code>diag</code> and <code>upper</code> above, specifying how the object should be printed.
call	optionally, the <code>call</code> used to create the object.
method	optionally, the distance method used; resulting from <code>dist()</code> , the <code>(match.arg()ed)</code> method argument.

[daisy](#) in the cluster package with more possibilities in the case of *mixed* (continuous / categorical) variables. [hclust](#).

## Examples

```
x <- matrix(rnorm(100), nrow=5)
dist(x)
dist(x, diag = TRUE)
dist(x, upper = TRUE)
m <- as.matrix(dist(x))
d <- as.dist(m)
stopifnot(d == dist(x))

## Use correlations between variables "as distance"
dd <- as.dist((1 - cor(USJudgeRatings))/2)
round(1000 * dd) # (prints more nicely)
plot(hclust(dd)) # to see a dendrogram of clustered variables

## example of binary and canberra distances.
x <- c(0, 0, 1, 1, 1, 1)
y <- c(1, 0, 1, 1, 0, 1)
dist(rbind(x,y), method= "binary")
## answer 0.4 = 2/5
dist(rbind(x,y), method= "canberra")
## answer 2 * (6/5)
dist(rbind(x,y), method= "jaccard")
## answer 0.4 = 2/5

## To find the names
labels(eurodist)

## Examples involving "Inf" :
## 1)
x[6] <- Inf
(m2 <- rbind(x,y))
dist(m2, method="binary")# warning, answer 0.5 = 2/4
## These all give "Inf":
stopifnot(Inf == dist(m2, method= "euclidean"),
          Inf == dist(m2, method= "maximum"),
          Inf == dist(m2, method= "manhattan"))
## "Inf" is same as very large number:
x1 <- x; x1[6] <- 1e100
```

```

stopifnot(dist(cbind(x ,y), method="canberra") ==
  print(dist(cbind(x1,y), method="canberra")))

## 2)
y[6] <- Inf #-> 6-th pair is excluded
dist(rbind(x,y), method="binary") # warning; 0.5
dist(rbind(x,y), method="canberra") # 3
dist(rbind(x,y), method="maximum") # 1
dist(rbind(x,y), method="manhattan")# 2.4

```

---

force.colour.scheme    *Based on predefined colour schemes, returns a vector of corresponding colours.*

---

## Description

Takes a vector of character strings and an scheme returns the matching colours as a vector.

## Usage

```

force.colour.scheme(
  x = NA,
  scheme,
  fill.colour = 'slategrey',
  include.names = FALSE,
  return.factor = FALSE,
  return.scheme = FALSE
);

```

## Arguments

x	The input character or numeric vector, defaults to NA incase return.scheme = TRUE.
scheme	A string representing a predefined scheme. Available schemes are: “anno-var.annotation”, “annovar.annotation.collapsed”, “annovar.annotation.collapsed2”, “tissue”, “sex”, “stage”, “risk”, “MSI”, “tumour”, “CNV”, “organism”, “chromosome” and “biomolecule”
fill.colour	Value to enter when value of x not present in scheme.
include.names	Should the output be a named vector or not?
return.factor	Should factors (scheme names) be returned?
return.scheme	Should the scheme list be returned?

## **Details**

The input character options for each colour scheme are as follows: `annovar.annotation`

- nonsynonymous snv
- stopgain snv
- stoploss snv
- frameshift deletion
- frameshift substitution
- splicing
- synonymous snv

`annovar.annotation.collapsed`

- nonsynonymous snv
- stopgain snv
- stoploss SNV
- frameshift indel
- splicing

`annovar.annotation.collapsed2`

- nonsynonymous
- stopgain-stoploss
- splicing
- frameshift indel
- synonymous
- utr5-utr3
- nonframeshift indel
- intronic
- intergenic

- 5

### **Value**

If multiple returns are requested, outputs a list (return.factor: factor length x with scheme names; scheme: list containing scheme names and colours; colours: vector length x with the required colours).

### **Author(s)**

Nicholas Harding

### **Examples**

```
annovar.output <- c('nonsynonymous snv', 'stopgain snv', 'none', 'stoploss snv',  
'frameshift deletion', 'frameshift substitution', 'splicing', 'none');  
force.colour.scheme(annovar.output, 'annovar.annotation');  
force.colour.scheme(annovar.output, 'annovar.annotation', 'white');
```

---

generate.at.final	<i>Generates alternative default tick mark locations for create.densityplot() and create.scatterplot()</i>
-------------------	--

---

### Description

Generates the tick mark locations for the output graphic of create.densityplot(), based on the values to the arguments of that function. This is needed to ensure the grid line and tick mark locations agree with each other.

### Usage

```
generate.at.final(  
  at.input,  
  limits,  
  data.vector  
);
```

### Arguments

at.input	either a logical scalar or a numeric vector
limits	either NULL or a numeric vector of length 2
data.vector	a numeric vector

### Value

Returns a numeric vector containing the tick mark locations of the densityplot.

### Author(s)

Kenneth C.K. Chu

---

get.corr.key	<i>Correlation Key</i>
--------------	------------------------

---

### Description

A function for adding correlation key legends to scatterplots.

**Usage**

```

get.corr.key(
  x,
  y,
  label.items = c("spearman", "spearman.p"),
  x.pos = 0.03,
  y.pos = 0.97,
  key.corner = NULL,
  key.cex = 1,
  key.title = NULL,
  title.cex = 1,
  alpha.background = 0,
  num.decimals = 2,
  border = 'white'
)

```

**Arguments**

<code>x</code>	A vector of values
<code>y</code>	Another vector of values with the same length as <code>x</code>
<code>label.items</code>	A vector of things to include in the key. Any combination of the following can be used. <code>c("spearman", "pearson", "kendall", "beta0", "beta1", "spearman.p", "pearson.p", "kendall.p", "beta1.p", "beta.robust", "beta.robust.p")</code> . "all" is an alternative to the full list.
<code>x.pos</code>	Horizontal position of the key corner
<code>y.pos</code>	Vertical position of the key corner
<code>key.corner</code>	The corner of the key defaults to the closest corner of the plot. This helps overcome some variable character and row sizing.
<code>key.cex</code>	Specifies the size of font for the key, defaults to 1.
<code>key.title</code>	The title of the key. Defaults to NULL
<code>title.cex</code>	The size of the key title. Defaults to 1
<code>alpha.background</code>	A value from 0 to 1 indicating the transparency of the legend box.
<code>num.decimals</code>	Number of decimal places to keep for spearman, pearson and kendall correlations. Defaults to 2.
<code>border</code>	Adds border around the key with the color specified, alpha background cannot be 0. Defaults to White.

**Value**

Returns a key in the format specified in the xyplot documentation.

**Author(s)**

Daryl Waggott

**See Also**

xyplot, plotmath

**Examples**

```
# create some temporary data
tmp.data <- data.frame(
  x = c(
    runif(n = 15, min = 0, max = 20),
    runif(n = 15, min = 80, max = 100),
    runif(n = 70, min = 0, max = 100)
  ),
  y = c(
    runif(n = 15, min = 0, max = 20),
    runif(n = 15, min = 80, max = 100),
    runif(n = 70, min = 0, max = 100)
  )
);

# a simple scatterplot with correlation key
BoutrosLab.plotting.general::create.scatterplot(
  formula = y ~ x,
  data = tmp.data,
  # filename = tempfile(pattern = 'get.corr.key-scatterplot', fileext = '.tiff'),
  xlab.label = 'X Axis Title',
  ylab.label = 'Y Axis Title',
  xlimits = c(0,100),
  ylimits = c(0,100),
  xat = seq(0,100,25),
  yat = seq(0,100,25),
  add.axes = FALSE,
  key = BoutrosLab.plotting.general::get.corr.key(
    tmp.data$y,
    tmp.data$x,
    label.items = c('spearman', 'spearman.p', 'kendall', 'beta1', 'beta1.p')
  )
);

# compare beta1 vs a robust estimate of the slope

# add an outlier
tmp.data <- rbind(tmp.data, c(2000,100));

BoutrosLab.plotting.general::create.scatterplot(
  formula = y ~ x,
  data = tmp.data,
  # filename = tempfile(pattern = 'get.corr.key.robust-scatterplot', fileext = '.tiff'),
  xlab.label = 'X Axis Title',
  ylab.label = 'Y Axis Title',
  xlimits = c(0,100),
  ylimits = c(0,100),
```

```
xat = seq(0,100,25),
yat = seq(0,100,25),
add.axes = FALSE,
key = BoutrosLab.plotting.general::get.corr.key(
  tmp.data$y,
  tmp.data$x,
  label.items = c('beta1', 'beta1.robust','beta1.p','beta1.robust.p')
)
);

# see create.scatterplot for an example of creating multiple keys using legends
```

---

get.correlation.p.and.corr

*Calculate a correlation and its statistical significance*

---

### Description

Returns the correlation and p-value for two variables using a user-specified correlation metric. P-values are estimated analytically, not via permutation-testing.

### Usage

```
get.correlation.p.and.corr(x, y, alternative = 'two.sided', method = 'pearson');
```

### Arguments

x	Vector of numbers to analyze
y	Vector of numbers to analyze
alternative	What is the null-hypothesis?
method	The correlation technique to use (passed directly to cor.test)

### Value

Returns a two-element vector containing the correlation and its p-value.

### Author(s)

Paul C. Boutros

**Examples**

```
get.correlation.p.and.corr(  
  x = runif(100),  
  y = runif(100),  
  method = 'pearson'  
);  
  
get.correlation.p.and.corr(  
  x = sample(1:10, 100, replace = TRUE),  
  y = runif(100),  
  method = 'spearman'  
);
```

---

`get.defaults`*Get operating system specific default properties*

---

**Description**

Returns the value for the property requested

**Usage**

```
get.defaults(  
  property = 'fontfamily',  
  os.type = .Platform$OS.type,  
  add.to.list = NULL,  
  use.legacy.settings = FALSE  
);
```

**Arguments**

<code>property</code>	The property to be retrieved
<code>os.type</code>	operating system (optional). valid values are: “windows”, “unix”
<code>add.to.list</code>	appends the requested property to this parameter
<code>use.legacy.settings</code>	boolean to set wheter or not to use legacy mode settings (font)

**Value**

Returns the value (list if `add.to.list` is passed) for the property requested given the `os.type` parameter. If latter is missing, it attempts to find user’s operating system

**Author(s)**

Syed Haider

**Examples**

```
# returns the fontfamily for current OS
get.defaults(property = "fontfamily");

# returns the fontfamily for unix
get.defaults(property = "fontfamily", os.type = 'windows');
```

---

<code>get.line.breaks</code>	<i>Get line breaks</i>
------------------------------	------------------------

---

**Description**

Given a vector, returns the indices (and an adjustment to draw lines between cells) where the value is not equal to the preceding value. Main use intended to be in `row.lines` arguments to `create.heatmap`

**Usage**

```
get.line.breaks(  
  x  
)
```

**Arguments**

`x` A vector, numeric, factor or character.

**Value**

A vector of integers representing the break points in the vector `x`

**Author(s)**

Nicholas Harding

**Examples**

```
set.seed(12345);  
values <- sample(  
  default.colours(3),  
  20,  
  replace = TRUE  
);  
get.line.breaks(values);
```

---

legend.grob	<i>Generate a legend grob</i>
-------------	-------------------------------

---

## Description

Takes a list and generates a grob representing one or more legends

## Usage

```
legend.grob(
  legends,
  label.cex = 1,
  title.cex = 1,
  title.just = 'centre',
  title.fontface = 'bold',
  title.y.coord = 1,
  font.family = NULL,
  size = 3,
  border = NULL,
  border.padding = 1,
  layout = c(1, length(legends)),
  between.col = 1,
  between.row = 1,
  use.legacy.settings = FALSE,
    x = 0.5,
    y = 0.5,
  background.col = "white",
  background.alpha = 0
);
```

## Arguments

legends	A list defining one or more legends. Each must be a separate component called 'legend'. Each component is a list with components 'colours', 'labels', 'border' (optional), 'title' (optional), and 'size' (optional). The 'colours' component is a vector of fill colours to be used for the rectangles, the 'labels' component is a vector of text labels corresponding to the colours, the 'border' component specifies the colours of the rectangle borders (defaults to black), and the 'title' component is a character string representing a title for the legend.
label.cex	Size of text labels in the legends, defaults to 1.
title.cex	Size of titles in the legends, defaults to 1.
title.just	Justification of titles in the legends. Defaults to 'centre'.
title.fontface	Font face of titles in the legends ('plain', 'bold', 'italic', etc.)
title.y.coord	Vertical position of title. Set to 1 for normal position, increase values >1 to raise the title higher.

font.family	Font to be used for legend text. If NULL, the default font is used.
size	Width of the legend boxes in 'character' units. If a 'size' argument is specified for a legend component, it will override this value.
border	A list of parameters (passed to gpar) specifying line options for the legend border. If NULL, no border is drawn.
border.padding	The amount of empty space (split equally on both sides) to add between the legend and its border, in 'lines' units. Defaults to 1.
layout	Numeric vector of length 2 specifying the number of columns and rows for the legend layout. Defaults to a 1-column layout. Note that legends are added to the layout in a row-wise order.
between.col	Amount of space to add between columns in the layout, in 'lines' units. Defaults to 0.5.
between.row	Amount of space to add between rows in the layout, in 'lines' units. Defaults to 0.5.
use.legacy.settings	boolean to set wheter or not to use legacy mode settings (font)
x	x coordinate in npc coordinate system
y	y coordinate in npc coordinate system
background.col	colour for the background of the legend grob
background.alpha	alpha for the background of the legend grob

**Value**

Returns an grob representing the legend(s)

**Implementation**

This function was initially created to be called from `create.heatmap` to draw a covariate legend. The decision to use a grob (grid graphical object) to represent the legend was made based on the format of the `levelplot` function in the `lattice` package. Since the legend argument of the function requires grobs, it was easiest to create a grob to represent the legend and then, if necessary, add this to any existing grobs (dendrograms, etc.) in the `create.heatmap` function using a grid layout.

An alternative method of creating the legend using the `barchart` function was tested, but it was unclear how to merge this barchart with the heatmap since the `c.trellis` function attempts to unify the format of the two images, and the use of viewports required that the plots be drawn, eliminating the possibility of suppressing output and saving the final graph as a trellis object.

---

microarray

*Microarray dataset of colon cancer patients*

---

## Description

Gene expression level changes of 2382 genes across 58 colon cancer patients. Additional data on the genes include chromosomal location and p-values. Additional data on the patient samples is found in in the "patient" dataset. The same patient samples are described in the "SNV" and "CNA" datasets.

## Usage

microarray

## Format

A data frame with 62 columns and 2383 rows. Columns 1-58 indicate the cancer patient sample. Columns 59-61 indicate the (sorted) chromosomal location by "Chr", "Start", and "End". Column 62 contains adjusted p-values. Each row is a different gene, and the row names are the gene names.

## Author(s)

Christine P'ng

**Examples**

```
create.dotmap(
  # filename = tempfile(pattern = 'Using_microarray_dataset', fileext = '.tiff'),
  x = microarray[1:5,1:5],
  main = 'microarray data',
  spot.size.function = function(x) {abs(x)/3;},
  xaxis.cex = 0.8,
  yaxis.cex = 0.8,
  xaxis.rot = 90,
  description = 'Dotmap created by BoutrosLab.plotting.general'
);
```

---

panel.BL.bwplot      *A lattice::panel.bwplot replacement that fixes colouring issues*

---

**Description**

Function `lattice::bwplot()` shows unexpected and unintuitive behaviour when colouring parameters of `par.settings` are vectors. The function `panel.BL.bwplot` fixes these issues. It should be called only from `lattice::bwplot()`. Use with caution. This function is invoked by `create.boxplot`

**Arguments**

...                    Pass through argument. See `lattice::bwplot()` for further details.  
 enable.warnings      Print warnings if set to TRUE, defaults to FALSE

**Author(s)**

Mehrdad Shamsi

---

patient                    *Dataset describing qualities of 58 colon cancer patients*

---

**Description**

A number of qualities describing 58 colon cancer patients. The same patient samples are described in the "microarray", "SNV" and "CNA" datasets.

**Usage**

patient

**Format**

A data frame with 5 columns and 58 rows. Each row indicates a different patient sample, with the following columns describing a feature of the sample:

**sex** The sex of the patient, either "male" or "female"

**stage** The stage of the patient's cancer, one of "I", "II", "III", "IV", or NA

**msi** The microsatellite instability of the cancer, either "MSS" or "MSI-High"

**prop.CAGT** The proportion of C to A or G to T base changes between the sample and reference genome

**prop.CTGA** The proportion of C to T or G to A base changes between the sample and reference genome

**prop.CGGC** The proportion of C to G or G to C base changes between the sample and reference genome

**prop.TAAT** The proportion of T to A or A to T base changes between the sample and reference genome

**prop.TGAC** The proportion of T to G or A to C base changes between the sample and reference genome

**prop.TCAG** The proportion of T to C or A to G base changes between the sample and reference genome

**Author(s)**

Christine P'ng

**Examples**

```
# use sample to set colour scheme
sex.colours <- replace(as.vector(patient$sex), which(patient$sex == 'male'), 'dodgerblue');
sex.colours <- replace(sex.colours, which(patient$sex == 'female'), 'pink');
len <- apply(SNV[1:15], 2, function(x){mutation.count <- length(which(x == 1))});

create.barplot(
  # filename = tempfile(pattern = 'Using_patient_dataset', fileext = '.tiff'),
  formula = len ~ colnames(SNV[1:15]) ,
  data = SNV,
  main = 'patient dataset',
  xaxis.rot = 45,
  ylimits = c(0,30),
  yat = seq(0,30,5),
  col = sex.colours,
  description = 'Barplot created by BoutrosLab.plotting.general'
);
```

---

`pcawg.colours`      *Return standard PCAWG colour palettes.*

---

### Description

Return standard PCAWG colour palettes. Case insensitive.

### Usage

```
pcawg.colours(
  x = NULL,
  scheme = NULL,
  fill.colour = 'slategrey',
  return.scheme = FALSE);
```

### Arguments

<code>x</code>	Character vector with terms to be mapped to colours. Ignored if <code>scheme='all'</code> or <code>return.scheme=TRUE</code> .
<code>scheme</code>	String specifying desired colour scheme. To see all available schemes, use <code>scheme='all'</code> , <code>returns.scheme=FALSE</code> .
<code>fill.colour</code>	Unrecognized output will be filled with this colour. Default to 'slategrey'.
<code>return.scheme</code>	TRUE/FALSE. Set to true to return full specified scheme. Set to false to map <code>x</code> to colours.

### Details

For further information on colour schemes, refer to the plotting guide.)

---

`scientific.notation`      *Use scientific notation in plots*

---

### Description

Returns an expression or list for plotting data in scientific notation

### Usage

```
scientific.notation(
  x,
  digits = 1,
  type = 'expression'
);
```

**Arguments**

x	The number we want in scientific notation.
digits	How many decimal places to keep.
type	The format to return the value in. Defaults to 'expression', also accepts 'list'

**Value**

Generates scientific notation either as an expression or list.

**Author(s)**

Paul C. Boutros

---

```
show.available.palettes
```

*Display the available colour palettes*

---

**Description**

Displays the available colour palettes

**Usage**

```
show.available.palettes(  
  type = 'general',  
  filename = NULL,  
  height = 5,  
  width = 8,  
  resolution = 300  
);
```

**Arguments**

type	Either “general”, “specific”, or “both” (default)
filename	Filename for tiff output, or if NULL returns the trellis object itself
height	Figure height, defaults to 8 inches – this is optimal for the specific schemes
width	Figure width, defaults to 12 – this is optimal for the specific schemes
resolution	Figure resolution in dpi, defaults to 300

**Author(s)**

Christine P’ng

### Examples

```
show.available.palettes(  
# filename = tempfile(pattern = 'show_case_specific_schemes', fileext = '.tiff'),  
type = 'specific',  
width = 10  
);  
  
show.available.palettes(  
# filename = tempfile(pattern = 'default_schemes', fileext = '.tiff'),  
type = 'general',  
height = 6,  
width = 8  
);
```

---

SNV

*Single nucleotide variant (SNV) data from colon cancer patients*

---

### Description

SNV calls from 30 genes across 58 colon cancer patients. Additional data on the patient samples is found in the "patient" dataset. The same patient samples are described in the "microarray" and "CNA" datasets.

### Usage

SNV

### Format

A data frame with 58 columns and 30 rows. The columns indicate the patient sample, and the rows indicate the gene. The contents of the data frame are either NA (indicating no SNV call was made) or one of:

- 1 - nonsynonymous SNV
- 2 - stopgain SNV
- 3 - frameshift insertion
- 4 - frameshift deletion
- 5 - nonframeshift insertion
- 6 - nonframeshift deletion
- 7 - splicing
- 8 - unknown

### Author(s)

Christine P'ng

**Examples**

```
len <- apply(SNV[1:15], 2, function(x){mutation.count <- length(which(x == 1))});

create.barplot(
  # filename = tempfile(pattern = 'Using_SNV_dataset', fileext = '.tiff'),
  formula = len ~ colnames(SNV[1:15]) ,
  data = SNV,
  main = 'SNV dataset',
  xaxis.rot = 45,
  ylimits = c(0,30),
  yat = seq(0,30,5),
  description = 'Barplot created by BoutrosLab.plotting.general'
);
```

---

thousands.split	<i>Divide strings into groups of thousands</i>
-----------------	--

---

**Description**

Takes a single number or list, and converts them into a new string with commas to mark the thousand multiples

**Usage**

```
thousands.split(
  nums
)
```

**Arguments**

nums            The numbers to be divided

**Author(s)**

Jeffrey Green

**Examples**

```
thousands.split(2344)

nums = c(1,2,34343,56565645645,676756,3434)

thousands.split(nums)

scatter.data <- data.frame(
  sample.one = microarray[1:800,1],
  sample.two = microarray[1:800,2],
  chr = microarray$Chr[1:800]
);
```

```

create.scatterplot(
  # filename = tempfile(pattern = 'Test_Divide_Thousands', fileext = '.tiff'),
  formula = sample.two ~ sample.one,
  data = scatter.data,
  main = 'Axes & Labels',
  # Axes and labels
  xlab.label = colnames(microarray[1]),
  ylab.label = colnames(microarray[2]),
  yaxis.lab = thousands.split(c(1,2323,4545,567676,454,76767678678,89,787)),
  xat = seq(0, 16, 2),
  yat = seq(0, 16, 2),
  xlimits = c(0, 15),
  ylimits = c(0, 15),
  xaxis.cex = 1,
  yaxis.cex = 1,
  xaxis.fontface = 1,
  yaxis.fontface = 1,
  xlab.cex = 1.5,
  ylab.cex = 1.5,
  description = 'Scatter plot created by BoutrosLab.plotting.general'
);

```

---

write.metadata

*Writes Metadata*

---

## Description

Utilizes exiftool to write metadata to generated plots. Writes the R version, lattice version, lattice-Extra version, BoutrosLab.plotting.general version, BoutrosLab.plotting.survival version, operating system, machine, author, image description.

## Usage

```

write.metadata(
  filename = NULL,
  description = NULL,
  verbose = FALSE
);

```

## Arguments

filename	Filename for output, or if NULL (default value) returns image unchanged.
description	Short description of image; default NULL
verbose	Option to standard output; default FALSE

**Value**

If filename is NULL, returns the image unchanged. If description is NULL, then the image is returned without the description tag.

Note: an easy way to view the metadata is by using the exiftool command.

**Author(s)**

Esther Jung

---

write.plot	<i>Simplifies plotting by standardizing and centralizing all output-handling</i>
------------	--

---

**Description**

Handle various graphics-driver weirdness and writes an output file and returns 1 or returns the trellis.object

**Usage**

```
write.plot(
  trellis.object,
  filename = NULL,
  additional.trellis.objects = NULL,
  additional.trellis.locations = NULL,
  height = 6,
  width = 6,
  size.units = 'in',
  resolution = 1000,
  enable.warnings = FALSE,
  description = "Created with BoutrosLab.plotting.general"
);
```

**Arguments**

trellis.object	A trellis object to be plotted
filename	Filename for output, or if NULL (default value) returns the trellis object itself. Will automatically grab the extension used.
additional.trellis.objects	List of additional trellis objects to add to main plot. Default to NULL
additional.trellis.locations	List of coordinates for additional trellis objects. Must be represented using variable names 'xleft', 'ybottom', 'xright' and 'ytop'. Defaults to NULL
height	Figure height, defaults to 6 inches
width	Figure width, defaults to 6 inches

size.units	Figure units, defaults to 'in'
resolution	Figure resolution, defaults to 1000
enable.warnings	Print warnings if set to TRUE, defaults to FALSE
description	Short description of image; default NULL

**Value**

Returns the trellis.object if filename is NULL or writes the plot to file if a filename is specified.

**Author(s)**

Paul C. Boutros

**Examples**

```
set.seed(253647)
# create test data
tmp.data <- data.frame(
  x = c(
    runif(n = 150, min = 0, max = 20),
    runif(n = 150, min = 40, max = 60),
    runif(n = 700, min = 0, max = 40)
  ),
  y = c(
    runif(n = 150, min = 0, max = 20),
    runif(n = 150, min = 40, max = 60),
    runif(n = 700, min = 0, max = 40)
  )
);

main.plot <- create.densityplot(
  x = list(
    X = tmp.data$x,
    Y = tmp.data$y
  ),
  xlab.label = 'X Axis Title',
  ylab.label = 'Y Axis Title',
  xlimits = c(-50,150),
  ylimits = c(0,0.03),
  xat = seq(-50,150,50),
  yat = seq(0,0.03,0.005),
  description = 'Image description goes here'
);

secondary.plot <- create.densityplot(
  x = list(
    X = tmp.data$x,
    Y = tmp.data$y
  ),
  xlab.label = '',
```

```
    ylab.label = '',
    xlimits = c(50,75),
    ylimits = c(0,0.015),
    xat = seq(0,150,10),
    yat = seq(0,0.015,0.005),
    xaxis.tck = 0,
    description = 'Image description goes here'
  );
