

Package ‘Rquake’

May 7, 2026

Type Package

Title Seismic Hypocenter Determination

Version 2.5-1

Date 2024-02-22

Depends R (>= 3.5.0)

Imports RPMG, RSEIS, GEOMap, MBA, minpack.lm

Author Jonathan M. Lees [aut, cre],
Baptiste Auguie [ctb]

Maintainer Jonathan M. Lees <jonathan.lees@unc.edu>

Description Non-linear inversion for hypocenter estimation and analysis of seismic data collected continuously, or in trigger mode. The functions organize other functions from 'RSEIS' and 'GEOMap' to help researchers pick, locate, and store hypocenters for detailed seismic investigation. Error ellipsoids and station influence are estimated via jackknife analysis. References include Iversen, E. S., and J. M. Lees (1996)<[doi:10.1785/BSSA0860061853](https://doi.org/10.1785/BSSA0860061853)>.

Description

Non-linear earthquake locations are estimated by sequential convergence to hypocenter solutions, along with error ellipsoids and 3D-plotting, using a coordination of functions from 'RSEIS', 'GEOmap', 'RFOC' and others for a complete seismic analysis from field campaign data or data extracted from online websites. Interactive codes for seismic phase picking can be combined with event location to go from raw seismic time series to earthquake analysis and spatial statistics.

Details

Rquake is a package for analysis of seismic data collected continuously, or in trigger mode. The functions organize other functions from 'RSEIS' and 'GEOmap' to help researchers pick, locate, and store hypocenters for detailed seismic investigation.

ASW.vel

1D Velocity Ecuador

Description

1D Velocity Ecuador

Usage

data(ASW.vel)

Format

a list of velocities for hypocenter relocation

Source

Mario Ruiz

Examples

```
data(ASW.vel)
data(wu_coso.vel)
data(fuj1.vel)
data(LITHOS.vel)

RSEIS::Comp1Dvels(c("ASW.vel", "wu_coso.vel", "fuj1.vel", "LITHOS.vel" ))
```

BLACKJACK

Jackknife earthquake location

Description

Perform jackknife on earthquake location by eliminating stations.

Usage

```
BLACKJACK(Ldat, vel)
```

Arguments

Ldat	event list
vel	Velocity model

Details

Stations are eliminated, not rows.

Value

event list with pseudo values

Note

events are located with P and S-wave arrivals, but code here should eliminate just stations.

```

checkLOCATEinput	<i>Check Location data</i>
------------------	----------------------------

Description

Check to see if location data has the minimally correct list components.

Usage

```
checkLOCATEinput(Ldat, EQ, vel = NULL)
```

Arguments

Ldat	list, must include: x,y,err, sec, cor (see details)
EQ	list, must include: x,y,z, t
vel	list, 1D velocity structure

Details

Input pick list must have at x,y,z, sec, cor, err elements for each station.

Value

logical: FALSE mean problem with data

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

checkLOCATEinput(Ldat, EQ)

```

clusterWPX

Cluster Analysis of Picks

Description

Given a pick file in WPX format, break the picks apart clustered according to single link cluster analysis.

Usage

```
clusterWPX(twpx, tol = 200, PLOT = FALSE)
```

Arguments

twpx	WPX list
tol	tolerance in seconds - all pick distances less than tol will be set to zero to force these to be associated.
PLOT	logical, if TRUE, add verbose plotting

Details

If there is not significant separation of picks, only one cluster is returned. To avoid spurious clusters, increase the tolerance.

Value

list of WPX lists

Note

Cluster depends on what one considers a cluster.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

s2 = RSEIS::setWPX(name="HI", yr=2011, jd=231, hr=5, mi=2, sec = runif(5))

s3 = RSEIS::catWPX(s1,s2)

twpx = data.frame(s3)
L3 = clusterWPX(twpx)
```

CONTPF

Button to Contour Pickfile Arrivals

Description

Button to Contour Pickfile Arrivals, used internally in swig.

Usage

```
CONTPF(nh, g, idev = 3)
```

Arguments

nh	RSEIS list
g	swig parameters
idev	device for plotting

Details

Driver for contPFarrivals

Value

Side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

contPFarrivals

Examples

```
if(interactive()){
##### interactive: addition of button in swig
data(GH, package='RSEIS')

buts = "CONTPF"
RSEIS::swig(GH, PADDLAB=buts, SHOWONLY=FALSE )
}
```

contPFarrivals *Contour Pickfile Arrivals*

Description

Contour plot of arrival times recorded in a pickfile list.

Usage

```
contPFarrivals(PF, stas, proj=NULL, cont=TRUE, POINTS=TRUE, image=FALSE ,
               col=RSEIS::tomo.colors(50), gcol="black", phase="P", add=TRUE)
```

Arguments

PF	Pickfile list in RSEIS format
stas	station list
proj	projection from GEOMap
cont	logical, add contour to plot
POINTS	logical, add mark up (stations) to plot
image	logical, add image to plot
col	color palette for image
gcol	color for contour lines
phase	character, phase to contour
add	logical, TRUE=add to existing plot

Details

Contours the arrival time. The earliest arrival is subtracted from each time pick. Uses only the phase indicated and there can be only one phase per station - default is earliest at each station.

Value

Graphical Side Effects

               image=TRUE , col=grcol, phase="P",
add=FALSE )

```

cosopix

Selection of pickfiles from Coso Geothermal Field

Description

Set of selected seismic arrival files with hypocenter locations.

Usage

```
data("cosopix")
```

Format

List consisting of:

- PF: original text version of file, as read from disk
- AC: Acard: hypocenter information
- LOC: location
- MC: Fault Mechanizm card
- STAS: Station information
- LIP: Error Ellipse
- E: E-card
- F: F-card
- filename: original file location
- UWFILEID: UW file identification

- comments: Comments on event location
- OSTAS: Station names
- H: High resolution location numbers
- N: Stations Not used in location

Details

Each element of this list is an individual earthquake record.

Examples

```

data(cosopix)
A = sapply(cosopix, '[[, 'LOC')
### gather stations

ST.name = vector(mode='character')
ST.lat = vector(mode='numeric')
ST.lon = vector(mode='numeric')
ST.z = vector(mode='numeric')

for(i in 1:length(cosopix))
{
g = cosopix[[i]]
g = data.frame(g$STAS )
w = which(!is.na(g$lat) )
ST.name = c(ST.name, g$name[w])
ST.lat = c(ST.lat, g$lat[w])
ST.lon = c(ST.lon, g$lon[w])
ST.z = c(ST.z, g$z[w])
}

notdup = !duplicated(ST.name)

name = ST.name[notdup ]
lat = ST.lat[notdup ]
lon =ST.lon[notdup ]
z = ST.z[notdup ]

plot(range(c(A[9, ], lon)) , range(c(A[8, ], lat)) , type='n',
xlab='Lon', ylab='Lat')
points(lon, lat, pch=6)

text(lon, lat, labels=name, pos=3)

points(A[9, ], A[8, ])

```

coso_sta_LLZ	<i>Coso Station File</i>
--------------	--------------------------

Description

Coso Station Location file, 1989-1999

Usage

```
data(coso_sta_LLZ)
```

Format

Name, Lat, Lon, Z

Source

Personal Files

References

Wu, H. and J. M. Lees (1996). Attenuation Structure of Coso Geothermal Area, California, from P Wave Pulse Widths, Bull. Seismol. Soc. Am., 86, 1574-1590.

defaultVEL	<i>Default Velocity Function</i>
------------	----------------------------------

Description

Default Velocity Function is returned in the event no velocity function is available.

Usage

```
defaultVEL(kind = 1)
```

Arguments

kind integer, 1=fuj1, 2=LITHOS

Details

A set of default velocity functions are available.

Value

velocity list, P and S waves

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

fuj1.vel

Examples

```
v = defaultVEL(1)
```

DistWeight

Distance weighting

Description

Distance weighting for non-linear earthquake location.

Usage

```
DistWeight(dist, err, distwt)  
DistWeightLL(lat, lon, elat, elon, err, distwt)  
DistWeightXY(x, y, ex, ey, err, distwt)
```

Arguments

dist	distance in km
err	sigma error in seconds
distwt	distance weighting parameter
lat	Latitude
lon	Longitude
elat	Event Latitude
elon	Event Longitude
x	station X(km)
y	station Y(km)
ex	event X (km)
ey	event Y (km)

Details

Based on Lquake scheme from University of Washington. If you need to reduce the effect of distance weighting, increase distwt.

Since the hypocenter moves between each iteration, the distance weighting is updated.

Value

vector of weights

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
DistWeight(1:10, .4, 20)
```

doAmap

Plot a map of station locations

Description

Plot a map of station locations

Usage

```
doAmap(stas, doproj = TRUE)
```

Arguments

stas	station list
doproj	logical, if TRUE, project (UTM) the data so plot is in units of km with the median lat-lon as the center. If FALSE, use the lat-lon coordinates.

Details

The range of the plot is expanded by 10 percent prior to plotting.

Value

list, GEOMap projection

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

gMAP,expandbound,GLOB.XY

Examples

```
data(coso_sta_LLZ)
### or read in from file:
## fsta = "staLLZ.txt"
## stas = scan(file=fsta,what=list(name="", lat=0, lon=0, z=0))
## stas$z = stas$z/1000

stas = coso_sta_LLZ

STA = doAmap(stas, doproj = TRUE)
```

eclipse

Error Elipse for Hypocenter Location

Description

Error Elipse for Hypocenter Location

Usage

```
eclipse(x, y, cov, wcols = c(1, 2), dof = 2, pct=0.05, ...)
```

Arguments

x	X-location for drawing
y	Y-location for drawing
cov	matrix, 3 by 3 Covariance matrix
wcols	vector, which columns to extract from cov, see details.
dof	Degrees of Freedom for 95 percent confidence
pct	Percent used for 2-sided confidence bounds, default=0.05
...	graphical parameters, par

Details

The 3 by 3 matrix is supplied and a 2 by 2 matrix is subtracted depending on which components are being drawn. For X-Y projections, use wcols=c(1,2). For vertical cross sections, rotate the cov matrix and then extract the columns.

Value

Side effects, graphical

eqwrapup

Earthquake Wrap Up

Description

Calculate error and summary information on earthquake location.

Usage

```
eqwrapup(Ldat, EQ, vel, distwt=20, lambdareg = 0.0, verbose=FALSE)
```

Arguments

Ldat	List of station arrival times, lat-lon, and uncertainty
EQ	List of earthquake location: Lat-Lon-z-t
vel	velocity model
distwt	distance weight, default=20
lambdareg	numeric, regularization parameter (default=0)
verbose	logical, TRUE=print information to screen

Details

Earthquakes are located with a generalized inverse (SVD). covariance matrix is extracted and 95% confidence bounds are calculated. Quality factors Q1 and Q1 estimate the quality iof the location based on the gap, minimum distance and rms.

Value

List	
rms	Root Mean Square Residual
meanres	Mean Residual
sdres	Standard Dev of residuals
sdmean	Standard error of mean residual
sswres	Sum squared weighted residuals
ndf	Number of Degrees of Freedom
sterrx	km, error in X (East-West)
sterry	km, error in Y (North-South)
sterrz	km, error in Z, (depth)
sterrt	s, Delta-time
cov	covariance matrix (used for error ellipsoids)
lam	lambda
gap	Spatial gap (max subtended angle)
herr	Horizontal error
distmin	Minimum distance to epicenter
Q1	Quality Factor based on Gap and RMS
Q2	Quality factor based on RMS, depth and min-Distance

Note

The Damping parameter (lambda) is set to zero. In the UW lquake program, lambda is set to 0.02.

names(kuality)

```

EQXYresid

Calculate Residuals

Description

Given an earthquake hypocenter and a list of station information, retrieve the station residuals.

Usage

```
EQXYresid(XY, vel = list(), h1 = c(0, 0, 0, 0), PLOT = FALSE)
```

Arguments

XY	matrix of station location and arrival times.
vel	list, RSEIS velocity model
h1	hypocenter location, c(x,y,z,t)
PLOT	logical, TRUE=plot the residuals

Details

The XY matrix is in cartesian coordinates, i.e. it has been projected into units of km. Only 1D velocity models are used at this time. Only residuals of P and S wave arrivals are estimated.

Value

vector, right hand side of the least squares problem.

```

Description

Given three angles return rotation matrix.

Usage

```
euler_passive(phi, theta, psi)
```

Arguments

phi	angle with x-axis
theta	angle with y-axis
psi	angle with z-axis

Details

Code borrowed from cpp code in package cda. used in rgl.ellipsoid.

Value

3 by 3 rotation matrix.

phi=30*pi/180 ; theta= 20*pi/180; psi = 6*pi/180
rr = euler_passive(phi,theta,psi)
```

getEulers

Get Eulers Angles

Description

Given a covariance matrix calculated with Vlocate, extract euler's angles for plotting in rgl

Usage

```
getEulers(R)
```

Arguments

R covarince matrix

Details

Extract the euler angles for plotting an ellipsoid. psi about X-axis, theta about Y axis, phi about Z-axis.

Value

vector, phi theta psi

Note

Used in conjunction with ROTcovQUAKE

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

ROTcovQUAKE

Examples

```
options(rgl.useNULL = TRUE)
R = matrix( runif(9), ncol=3)

getEulers(R)
```

getGAP

Get Seismic Gap

Description

Given an earthquake and a set of stations, return the maximum angle subtended between adjacent stations relative to the epicenter.

Usage

```
getGAP(EQ, Ldat, PLOT = FALSE)
```

Arguments

EQ	List, Earthquake location, elements (lat, lon) must be present
Ldat	List, station information, (lat, lon) must be present
PLOT	logical, plot the stations and show the gap

Details

The angles are calculated in cartesian coordinates with the epicenter at the origin using a UTM projection.

Value

numeric, gap in degrees

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

}

```

GETpsTT

Get Pand S travel times and derivatives

Description

Get Pand S travel times and derivatives

Usage

```
GETpsTT(phase, eqz = 6, staz = 0, delx = 1, dely = 1, deltadis = 6, vel)
```

Arguments

phase	character vector, phase
eqz	event depth
staz	station elevation
delx	km, delta X
dely	km, delta Y
deltadis	km, distance
vel	velocity models (P and S)

Details

Creates a vector of travel times, and a matrix and derivatives used for inversion.

Value

list:	
TT	travel time vector
Derivs	matrix of derivatives, dtdx, dtdy, dtdz

```

getregionals

Extract regional events

Description

Extract regional events from a hypocenter list (catalog)

Usage

```
getregionals(KAT, Mlat, Mlon, rad = 1000, t1 = 1, t2 = 2)
```

Arguments

KAT	catalog list: must include lat, lon and jsec.
Mlat	central latitude
Mlon	central longitude
rad	radius (km)
t1	start time (julian days)
t2	end time (julian days)

Details

Given an earthquake catalog from PDEs, for example, extract the events that are close to a network in a given time frame. The limited data set may be used to help predict arrival times for known hypocenter locations.

The time jsec is in julian days, i.e. $jsec = jd + hr/24 + mi/(24*60) + sec/(24*3600)$ so that they can be compared to t1 and t2.

Value

Catalog

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

degz = 5
KAT = list(lat=runif(N, Mlat-degz, Mlat+degz) ,
           lon=runif(N, Mlon-degz, Mlon+degz) )

##### random times in January
KAT$jsec = runif(N, 1, 30) + runif(N, 0, 24)/(24) + runif(N, 0, 59)/(24*60)

##### extract regional events
localeqs = getregionals(KAT, Mlat, Mlon, rad=200 , t1=NULL, t2=NULL)

plot(KAT$lon, KAT$lat, pch=8, col=grey(0.75) )
points(KAT$lon[localeqs], KAT$lat[localeqs], pch=1, col='red', cex=1.5 )
```

getresidTT

Travel time residuals

Description

Given an earthquake location and a set of arrival times, return a vector of residuals.

Usage

```
getresidTT(Ldat, EQ, stas, vel)
```

Arguments

Ldat	List of arrival times
EQ	List of event location, (lat, lon, z, and time)
stas	station location list
vel	list, velocity structure

Details

1D travel time calculation.

Value

vector of residuals

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

```

```
resids = getresidTT(Ldat, g1$LOC, g1$STAS , vel)
```

Gfirstguess

First guess from a pick file

Description

Extract the lat lon from the pick file.

Usage

```
Gfirstguess(Ldat, type = "first")
```

Arguments

Ldat	Matrix of data information
type	one of "first", "mean", or "median"

Details

Either the earliest arrival or the average station is returned. Used internally in the earthquake location program to provide a first guess.

Value

vector, lat, lon, z and tee

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

Klocate

Examples

```
data(GH, package='RSEIS')

g1 = Gfirstguess(twpx, type = "first")
```

gMAP

Generic Map Button

Description

Generic Map Button

Usage

```
gMAP(nh, g, idev = 3)
```

Arguments

nh	RSEIS structure
g	parameters used in swig
idev	device for plotting (not used)

Details

This is a button used internally in swig

Value

Graphical Side Effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

swig

Examples

```
if(interactive()){
#### this is interactive
### adds button to swig menu
data(GH, package='RSEIS')

butts = "gMAP"

}
```

GPIX

PICK Buttons for swig

Description

defining functions for swig

Usage

GPIX(nh, g)

Arguments

nh waveform list for RSEIS
g plotting parameter list for interactive program

Details

Buttons can be defined on the fly.

GPIX Multiple picks on a panel

Value

The return value depends on the nature of the function as it is returned to the main code swig. Choices for returning to swig are: break, replot, revert, replace, donothing, exit.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

}
```

HiJACK

Jackknife a list of events

Description

Jackknife a list of events

Usage

```
HiJACK(lps, sta, vel)
```

Arguments

lps	list of earthquake event pickfiles, each element is an individual pickfile list, with STAS: relative timing of phase arrivals
sta	station list
vel	velocity list

Details

Driver for BLACKJACK

Value

jackknife pseudovalues for each event

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

References

Iversen, E. S., and J. M. Lees (1996), A statistical technique for validating velocity models, Bull. Seismol. Soc. Am. 86(6), 1853-1862.

COS0jack = HiJACK(cosopix, coso_sta_LLZ, wu_coso.vel)

proj = GEOmap::setPROJ(2, mean(coso_sta_LLZ$lat),
mean(coso_sta_LLZ$lon))

#### show stats
plotJACKLLZ(COS0jack, coso_sta_LLZ, proj, PLOT=1 )

#### show maps
plotJACKLLZ(COS0jack, coso_sta_LLZ, proj, PLOT=2 )
```

imageINFLUENCE

Image Influence of stations

Description

Plot contours/image of Influence scores.

Usage

```
imageINFLUENCE(B, sta, proj)
```

Arguments

B	Pseudovalue list
sta	station location list
proj	projection list

Details

Following jackknife - plot results. this function is called by plotJACKLLZ.

Value

side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

References

Iversen, E. S., and J. M. Lees (1996), A statistical technique for validating velocity models, *Bull. Seismol. Soc. Am.* 86(6), 1853-1862.

INITpickfile

Initialize a pickfile

Description

Initialize a pickfile

Usage

```
INITpickfile(stas = NULL, src = NULL, WPX = NULL)
```

Arguments

stas	station list
src	hypocenter location
WPX	GPIX or PPIX picks from swig

Details

Initialize a pickfile with a set of picks extracted from swig.

Value

list, pickfile

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

EmptyPickfile

Examples

```
data(GH, package='RSEIS')
WW = RSEIS::uwpfile2ypx(GH$pickfile)

PF = INITpickfile(stas=GH$stafile, src=NULL, WPX=WW )
```

Klocate

Earthquake Hypocenter Location

Description

Earthquake Hypocenter Location

Usage

```
Klocate(Ldat, sol = c(0, 0, 0, 0), vel=defaultVEL(6),
distwt = 20, errtol = c(0.01, 0.01, 0.01), maxit = 20,
Lambda = 1, guessdepth = 6, APLOTT = FALSE,
stas = list(name = "", lat = NA, lon = NA, z = NA))
```

Arguments

Ldat	swig pick list
sol	vector, initial solution
vel	velocity list
distwt	distance weight parameter
errtol	error tolerance
maxit	Maximum number of iterations
Lambda	damping parameter
guessdepth	initial depth for guess
APLOTT	logical, plot intermediate solutions
stas	station list

Details

Inversion is done with SVD.

Value

Event location in Lat-Lon-Z-T.

Note

Damped least squares.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

swig, defaultVEL

Examples

```

## points(g1$H$lon, g1$H$lat, pch=8, col='red')

w1 = which(!is.na(g1$STAS$lat))
sec = g1$STAS$sec[w1]

N = length(sec)
Ldat = list(
  name = g1$STAS$name[w1],
  sec = g1$STAS$sec[w1],
  phase = g1$STAS$phase[w1],
  lat=g1$STAS$lat[w1],
  lon = g1$STAS$lon[w1],
  z = g1$STAS$z[w1],
  err= g1$STAS$err[w1],
  yr = rep(g1$LOC$yr , times=N),
  jd = rep(g1$LOC$jd, times=N),
  mo = rep(g1$LOC$mo, times=N),
  dom = rep(g1$LOC$dom, times=N),
  hr =rep( g1$LOC$hr, times=N),
  mi = rep(g1$LOC$mi, times=N) )

##### let the code determine the initial guess
NEW = Klocate(Ldat )
```

lastPIX *Last Pix*

Description

'RSEIS' Button: Restore Last WPX file from memory. Function is used internally in swig.

Usage

```
lastPIX(nh, g)
editPIX(nh, g)
```

Arguments

nh	GH list from RSEIS
g	parameters from swig

Value

New WPX list attached to g

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

latlonz2wpX *Add Lat-Lon-Z to WPX list*

Description

Given an existing list of seismic picks, add Latitude, Longitude and Elevation associated with the indicated station.

Usage

```
latlonz2wpX(twpX, stas)
```

Arguments

twpX	List of picks from swig
stas	station list

Details

The names of the stations are matched to the station names in the station file.

Value

Pick file with LLZ added as list members.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

Klocate

Examples

```
data(GH, package='RSEIS')
WW = RSEIS::uwpfile2ypx(GH$pickfile)

twpx = latlonz2wpx(WW, GH$pickfile$STAS )
```

LDATlist

List location data

Description

List location data

Usage

```
LDATlist(g1, w1)
```

Arguments

g1	loc list
w1	index

Value

side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

LeftjustTime *Adjust times relative to least minute.*

Description

Adjust times relative to least minute.

Usage

```
LeftjustTime(g1)
```

Arguments

g1 list with times, yr, jd, hr, mi, sec

Details

Reutrns the list with the times adjusted to the least minimum (left adjusted)

Value

list is returned.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

reccdate

Examples

```
set.seed(0)
```

```
d1 = list(yr=rep(2005, 4), jd=rep(5, 4), hr=rep(6, 4), mi=c(1,1,2,3), sec=runif(4, 0, 60))
LeftjustTime(d1)
```

`legitWPX`*Legitimate Pix*

Description

Check WPX list for legitimate picks

Usage

```
legitWPX(twpx, quiet=TRUE)
```

Arguments

<code>twpx</code>	pick information list (WPX)
<code>quiet</code>	logical, default=TRUE, FALSE generates an error message

Details

Used internally to test if a WPX list has legitimate picks. Initially a list is generated with NA and 0 values in the place holders. If no legitimate picks are added, the list still exists, but the picks are bogus, so this routine will return 0.

Value

integer: 0=not legitimate, 1=legitimate

Note

Currently only the name is tested for all(NA), but this might be changed in the future for a more sophisticated test.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

PCsaveWPX

Examples

```
### test fails

library(RSEIS)

```

```
gwpX = RSEIS::uwpfile2ypX(GH$pickfile)
legitWPX(gwpX)
```

MeanStaDist

Mean Station Distance

Description

calculate the mean km distance of a set of Lat-lon pairs

Usage

```
MeanStaDist(Ldat)
```

Arguments

Ldat station list with elements of Lat-Lon

Details

Given a list with elements named lat and lon, find the mean station distance.

Value

scalar

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

setPROJ, GLOB.XY, dist

Examples

```
data(GH, package='RSEIS')
MeanStaDist(GH$pickfile$STAS)
```

NLSlocate *Nonlinear Least Squares Location*

Description

Nonlinear Least Squares Location using Gieger's method

Usage

```
NLSlocate(GH, vel = list(), init = c(0, 0, 0, 0), PLOT = FALSE)
```

Arguments

GH	List, RSEIS
vel	velocity model
init	initial guess for event location
PLOT	logical, TRUE=plot

Details

This is an adaptation of non-linear least squares inversion for earthquake location. A residual function is supplied, and iterations are performed until the location is determined.

Value

vector, new location

Note

At this stage there are no weighting mechanisms or code to eliminate data that has residuals that are too large.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

References

Lee, W.H.K., and S.W. Stewart, Principles and Applications of Microearthquake Networks, Academic Press, New York, 1981.

See Also

swig

Examples

```
data(GH, package='RSEIS')
### location is:
eqsol = NLSlocate(GH, vel=GH$velfile, PLOT=TRUE )
```

OnePerSta

One Phase Pick Per Station

Description

Require only one pick per station of a specified phase.

Usage

```
OnePerSta(twpx, phase = "Y")
```

Arguments

twpx	WPX list
phase	character, specific phase

Details

This is used to reduce the number of picks for specific station and phase. The purpose is avoid multiple P-wave phases for each station in the earthquake location routines.

Value

WPX list

Note

For S-waves there may be multiple S-wave arrivals, as in the case for shear wave splitting. In that case it is probably best to name the phases differently, as in S1, S2, for example.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

cleanWPX, repairWPX

```
s1 = RSEIS::setWPX(name="HI", phase="P", yr=2011, jd=231, hr=4, mi=3, sec = runif(5))
s2 = RSEIS::setWPX(name="BYE", phase="P", yr=2011, jd=231, hr=4, mi=3, sec = runif(5))

s3 = RSEIS::catWPX(s1, s2)

s4 = OnePerSta(s3, phase = "P")
```

PCfiledatetime	<i>Create a character string from a date</i>
----------------	--

Description

Create a character string from a date for naming unique output files.

Usage

```
PCfiledatetime(orgtim, tims)
```

Arguments

orgtim	time vector of length 5: c(yr, jd, hr, mi, sec)
tims	seconds to add to orgtim

Value

filename	character string
----------	------------------

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
library(RSEIS)
data(GH, package='RSEIS')

g1 = getGHtime(GH)
g2 = unlist(g1)

PCfiledatetime(g2, 1)
```

PCsaveWPX

Save WPX list

Description

Save a WPX list to a file on the local file system.

Usage

```
PCsaveWPX(twpx, destdir = NULL)
```

Arguments

twpx	WPX list
destdir	character, destination directory, default=NULL

Details

Creates a file with the list as in native binary format. This file can be loaded with the standard load function in R. The name of the file is created by using the minimum time extracted from the WPX list. The suffix on the file name is RDATA. When reading in, the object created is named "twpx" for further processing.

destdir must be set, otherwise the destination directory will be temporary. Typically this is set to a local directory where the user has write access.

Value

Side effects on file system. The name of the output file is returned.

Note

User must have write access to the destination directory.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

```
##### save files as RDS to users disk

s1 = RSEIS::setWPX(name="HI", yr=2011, jd=231, hr=4, mi=3, sec = runif(5))

hh = PCsaveWPX(s1, destdir= tempdir() )

### read in the data
twpx = readRDS(hh)

data.frame(twpx)
```

PFoutput

*Write a pickfile to disk***Description**

Write a pickfile to disk, after updating the earthquake location, in a variety of formats.

Usage

```
PFoutput(PF, stas = NULL, sol = NULL, format = 0, destdir=NULL)
```

Arguments

PF	Pickfile list from RSEIS
stas	station list
sol	solution vector, (lat, lon, z, t0)
format	integer, 0=all formats, 1=native R, 2=UW, 3=csv)
destdir	character, full path to destination directory, default=NULL)

Details

Writes files to disk in local directory.

Value

Side effects: writes files to user's disk

Note

The destdir (destination directory) must be provided for the file to be save properly.

Creates a file name and writes to disk in a variety of formats.

A destdir that is NULL will result in writing to a temporary file.

}
```

plotEQ

Plot Earthquake location

Description

Plot Earthquake location

Usage

```
plotEQ(Ldat, AQ, add = FALSE, prep = FALSE,
TIT = "UTM Projected Stations", proj = NULL,
xlim = NULL, ylim = NULL)
```

Arguments

Ldat	Data list
AQ	Earthquake solution (location)
add	logical, TRUE=add to plot
prep	preparation
TIT	title
proj	projection list
xlim	2-vector, x limits (km)
ylim	2-vector, y limits (km)

Details

used internally in RElocateEQ

Value

graphical side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

plotJACKLLZ

BoxPlot Jackknife of station locations

Description

BoxPlot Jackknife of station locations

Usage

plotJACKLLZ(hjack, sta, proj = NULL, PLOT=1)

Arguments

hjack	Output of hijack
sta	station location list
proj	projection list
PLOT	plotting flag, 1,2. if plot=1 plot only boxplot, if plot=2 plot only map. Default=0

Details

takes the output of the HiJack function and extracts the pseudovalues and influence information for boxplots.

Value

Graphical side effects and

X	influence of lon
Y	influence of lat
Z	influence of depth

PostREQquake

Post Processing on EQquake

Description

Post Processing on EQquake

Usage

PostREQquake(XQ, proj)

Arguments

XQ	List of Earthquakes
proj	projection list

Details

Following event locations, plot.

Value

graphical side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

PostVquake

Plotting error ellipsoids of many events

Description

Plotting error ellipsoids of many events

Usage

PostVquake(MANYeq, GX, GY, XY, proj, add=FALSE, ...)

Arguments

MANYeq	List of earthquakes following Vlocate
GX	X-bounds for plot
GY	Y-bounds for plot
XY	station locations in km
proj	projection list
add	logical; if TRUE, add to existing plot (DEFAULT=FALSE)
...	graphical parameters for plotting (see par)

Details

Plots the event and the error ellipsoids

Value

Graphical side effects

Note

This is used to plot many event locations and their error ellipsoids

Qrangedatetime

Range of Date Time

Description

Return the range of dates and times for any list with a date/time list

Usage

Qrangedatetime(D)

Arguments

D info list from RSEIS seismic data list

Value

min	date time list
max	date time list

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
library(RSEIS)
data(GH, package='RSEIS')

v = Qrangedatetime(GH$info)
```

ReSet

Button to reset the choices of station and component

Description

Button to reset the choices of station and component in swig and Mine.seis

Usage

```
ReSet(nh, g)
```

Arguments

nh	RSEIS list
g	swig parameters

Details

Driver for SELstaDB

Value

Side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

SELstaDB, Mine.seis

Examples

```
if(interactive()){
  data(GH, package='RSEIS')

  buts = "ReSet"
  RSEIS::swig(GH, PADDLAB=butts)
}
```

ripper

Rip off Event location information

Description

Extract Event location information following Vlocate

Usage

```
ripper(AQ)
```

Arguments

AQ event location list

Details

Extract lat-lon from event locations to track intermediate solutions and convergence

Value

2 by N matrix, lat-lon

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

```

Rowz2Keep	<i>Rows to Keep for inversion</i>
-----------	-----------------------------------

Description

Selects which rows in the hypocenter determination to keep during non-linear iterations based on robust residual elimination.

Usage

```
Rowz2Keep(Ldat, EQ, G1, RESMAX)
```

Arguments

Ldat	List of station arrivals
EQ	Earthquake location
G1	derivative and travel time estimates
RESMAX	2-vector for P and S-wave residual maxima

Details

This is a utility used internally.

Residuals greater than the respective maxima provided are eliminated in the svd inversion. If fewer than 4 remain, the smallest 4 rows are returned.

Value

Index of good rows

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

XYlocate

RQ

Rquake Button

Description

Driver for NLSlocate

Usage

```
RQ(nh, g, idev = 3)
```

Arguments

nh	RSEIS list
g	parameters from swig
idev	device for plotting

Details

Button to be called from within swig after picking.

Value

new hypocenter

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

NLSlocate, EQXYresid, XYSETUP, swig,chak

Examples

  buts = c("GPIX", "PPIX", "PickWin",
           "fspread", "gMAP", "RQ", "CONTPF")

RSEIS::swig(GH, PADDLAB=buts)
}
```

SavePF

Save Pick File Button

Description

Save a pick file from within swig

Usage

SavePF(nh, g)

Arguments

nh	RSEIS data list
g	list of parameters internal to swig

Details

Uses PFoutput to save a pickfile to disk.

Value

Side Effects

Note

Pickfile is saved as a native R file with wpx extension

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

PFoutput

Examples

```
if(interactive()){  
  data(GH, package='RSEIS')  
  buts = "SavePF"  
  RSEIS::swig(GH, PADDLAB=buts)  
}
```

SELstaDB*Pick stations and components interactively*

Description

Pick stations and components interactively. This is a routine used in swig.

Usage

```
SELstaDB(IDB, sel=1, newdev=TRUE, STAY=FALSE)
```

Arguments

IDB	list with component vectors, usta and ucomp
sel	vector of index to selected traces
newdev	logical, whether to create a new device.
STAY	logical, whether to keep device active.

Value

vector of index to list of stations and components

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

infoDB, makeDB

Examples

```

  ### or, as an example:  
  data(GH, package='RSEIS')  
  
  DBnov = list(usta = unique(GH$STNS), unique(GH$COMPS))  
  
  k = SELstaDB(IDB)  
  
}
```

`UPdateEQLOC`*Update an Earthquake location*

Description

Update an Earthquake location following a relocation.

Usage

```
UPdateEQLOC(PF, sol, vel, stas = NULL)
```

Arguments

<code>PF</code>	Pickfile List
<code>sol</code>	solution vector (lat, lon, z, t0)
<code>vel</code>	1D velocity model
<code>stas</code>	station list (name, lat, lon, z)

Details

After re-picking or changing the model or the station corrections, update the event location in the pickfile.

Value

Pickfile List

  dom = rep(g1$LOC$dom, times=N),
  hr =rep( g1$LOC$hr, times=N),
  mi = rep(g1$LOC$mi, times=N) )

wstart = which.min(Ldat$sec)
EQ = list(lat=Ldat$lat[wstart], lon=Ldat$lon[wstart], z=6, t=Ldat$sec[wstart] )

AQ = Vlocate(Ldat,EQ,vel,
  distwt = 10,
  lambdaereg =100 ,
  REG = TRUE,
  WTS = TRUE,
  STOPPING = TRUE,
  tolx = 0.01,
  toly = 0.01 ,
  tolz = 0.05, maxITER = c(7,5,7,4) , RESMAX = c(0.1, 0.1), PLOT=FALSE)

sol = c(AQ$EQ$lat, AQ$EQ$lon, AQ$EQ$z, AQ$EQ$t)

upf = UPdateEQLOC(g1, sol , vel, stas=g1$STAS)

```

Vlocate

Hypocenter Determination

Description

Hypocenter Determination with error checking and adjustments.

Usage

```

Vlocate(Ldat,EQ,vel,
  distwt = 10,
  lambdaereg =100,
  REG = TRUE,
  WTS = TRUE,
  STOPPING = TRUE,
  tolx = 0.1,

```

```

toly = 0.1,
tolz = 0.5,
RESMAX = c(.4, .5),
maxITER = c(7, 5, 7, 4),
PLOT=FALSE)

```

Arguments

Ldat	list, must include: lat, lon ,err, sec, cor (see details)
EQ	list, must include: lat,lon,z, t
vel	list, 1D velocity structure
distwt	distance weighting factor
lambdareg	regularization parameter for damping
REG	logical, TRUE=use regularization
WTS	logical, TRUE==use weighting
STOPPING	logical, TRUE=use stopping criteria
tolx	numeric, tolerance in km in x direction
toly	numeric, tolerance in km in y direction
tolz	numeric, tolerance in km in z direction
RESMAX	vector, residual max for P and S, default=c(4,5)
maxITER	vector, Maximum number of iterations for each section of the location routine, default=c(7,5,7,4)
PLOT	logical, plot results during iterations

Details

This is a wrapper for XYlocate, only here the lat-lon of the stations is passed and the code does the projection internally.

There are 3 main loops, each controlled by differing input params: first event is located only in XY keeping the depth fixed (7 iterations). Then an initial free solution is estimated using robust elimination of residual based on RESMAX (5 iterations). Finally a set of 7 iterations is applied providing the final estimate, along with error bars, ellipsoids, etc.

In the event no good solution is derived, the regularization parameter is doubled and a loop with 4 iterations is applied, and the result returned.

Value

list:	
EQ	Hypocenter lcoation
ERR	Error Analysis
its	number of iteration
Ksolutions	list of matrices, each with intermediate x,y,z,t locations

Note

The schedule may be adjusted by duplicating this function and changing the maxit parameters.

```

XYerror.bars

Error Bars in X and Y

Description

Error Bars in X and Y

Usage

```
XYerror.bars(x, y, xlo = 0, xhi = 0, ylo = 0,  
yhi = 0, pch = 1, col = 1, barw = 0.1, add = FALSE, ...)
```

Arguments

x	X-values
y	Y-values
xlo	X Lower limit of error bars
xhi	X Upper limit of error bars
ylo	Y Lower limit of error bars
yhi	Y Upper limit of error bars
pch	plotting character
col	color
barw	width of the bar (inches)
add	logical, add=FALSE starts a new plot
...	other plotting parameters

Value

graphical side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```

set.seed(0)
zup = rnorm(10)

x = 1:10
y = 2*x+5+zup

ydown = rnorm(10)
ydown = ydown-min(ydown)+.2

yup = rnorm(10)
yup = yup-min(yup)+.2

zup = rnorm(10)
xup = zup-min(zup)+.5
xdown = rnorm(10)
xdown = xdown-min(xdown)+.2

#### example with different error on either side:
XYerror.bars(x, y, y-ydown, y+yup, x-xdown, x+xup,
  pch = 1, col = 'brown' , barw = 0.1, add
= FALSE)

```

XYlocate

Locate Earthquake with UTM projection

Description

Non-linear hypocenter location with UTM geographical projection. Used for locating earthquakes in local or regional settings.

Usage

```

XYlocate(Ldat, EQ, vel, maxITER = 10, distwt = 10,
  lambdareg = 100, FIXZ
= FALSE, REG = TRUE, WTS = TRUE, STOPPING = TRUE,
RESMAX = c(.4,.5), tolX = 0.005, toly = 0.005,
  tolyz = 0.01, PLOT = FALSE)

```

Arguments

Ldat	list, must include: x,y,err, sec, cor (see details)
EQ	list, must include: x,y,z, t
vel	list, 1D velocity structure
maxITER	Maximum number of iterations
distwt	distance weighting factor
lambdareg	regularization parameter for damping
FIXZ	logical, TRUE = fix depth, i.e. only calculate x,y,t
REG	logical, TRUE=use regularization
WTS	logical, TRUE==use weighting
STOPPING	logical, TRUE=use stopping criteria
RESMAX	vector, residual max for P and S, default=c(4,5)
tolx	numeric, tolerance in km in x direction
toly	numeric, tolerance in km in y direction
tolz	numeric, tolerance in km in z direction
PLOT	logical, plot results during iterations

Details

Input pick list must have at x,y,z, sec, cor, err elements for each station. If no station correction is available it is set to zero. If no uncertainty (err) is available, it is set to 0.05 sec. Each station must have a finite x-y coordinate and arrival time in seconds. Events are located relative to the minute.

Routine uses the svd in a sequence of linear inversions to estimate the nonlinear location.

Value

List:

EQ	list, Earthquake hypocenter and time
its	number of iterations
rms	rms residual
wrms	wheighted rms residual
used	vector, index of used equations
guesses	list of x,y,z,t intermediate locations when converging

Note

This routine should be called by a wrapper (Vlocate) that applies the algorithm several times and changes parameters based on the quality.

If RESMAX is used and the robust approach yields fewer than 4 equations, the best (smallest) four residuals will be used to determine the event location.

```

XYSETUP

Set up matrix for hypocenter inversion

Description

Set up matrix for hypocenter inversion

Usage

```
XYSETUP(STAS, init, vel)
```

Arguments

STAS	station information from pickfile
init	initial event location
vel	list, velocity

Details

This sets up the matrix used for nonlinear inversion. The code does not include information on the weighting. Station corrections are included.

The STAS are an internal component of the pickfile.

Value

matrix

Note

Need scheme for weighting according to errors in picks and distance weighting.

```

Y2Pphase

Convert Y-phase to P-phase

Description

Removes extraneous other-phase from a pick file. If Ypix were made initially as a rough pick, this removes them.

Usage

```
Y2Pphase(twpx, phase)
```

Arguments

twpx	WPX list
phase	character, phase to exchange to P

Details

Initially many events may be picked using GPIX button. These should be removed after the P-phases have been determined with PickWin.

Value

WPX returned without other-phases
