Package 'fBasics'

May 8, 2026

Title Rmetrics - Markets and Basic Statistics

Version 4052.98

Description Provides a collection of functions to
explore and to investigate basic properties of financial returns
and related quantities.
The covered fields include techniques of explorative data analysis
and the investigation of distributional properties, including
parameter estimation and hypothesis testing. Even more there are
several utility functions for data handling and management.

Depends R (>= 2.15.1)

Imports timeDate, timeSeries (>= 4021.105), stats, grDevices,
graphics, methods, utils, MASS, spatial, gss, stabledist

Suggests interp, RUnit, tcltk

LazyData yes

License GPL (>= 2)

Encoding UTF-8

`fBasics-package` *Portfolio modelling, optimization and backtesting*

Description

The Rmetrics **fBasics** package is a collection of functions to explore and to investigate basic properties of financial returns and related quantities.

The covered fields include techniques of explorative data analysis and the investigation of distributional properties, including parameter estimation and hypothesis testing. Evenmore there are several utility functions for data handling and management.

Details

Note by the maintainer (GNB): Some of the information on this overview page may be outdated. The documentation website https://geobosh.github.io/fBasicsDoc/ of the package (generated with pkgdown) provides up-to-date help pages, arranged by topic.

1 Introduction

The fBasics package contains *basics tools* often required in computational finance and financial engineering. The topics are: basic statistics functions, financial return distributions, hypothesis testing, plotting routines, matrix computations and linear algebra, and some usefule utility functions.

2 Basic Statistics Functions

Financial Return Statistics

`basicStats`	`Returns a basic statistics summary`

Distribution Function of Maximum Drawdowns

`dmaxdd`	`Density function of mean Max-Drawdowns`
`pmaxdd`	`Probability function of mean Max-Drawdowns`
`rmaxdd`	`Random Variates of mean Max-Drawdowns`
`maxddStats`	`Expectation of Drawdowns for BM with drift`

Calculation of Sample Moments

`sampleLmoments`	`Computes sample L-moments`
`sampleMED`	`Returns sample median`
`sampleIQR`	`returns sample inter quartal range`
`sampleSKEW`	`returns robust sample skewness`
`sampleKURT`	`returns robust sample kurtosis`

Bivariate Interpolation:

```
akimaInterp          Interpolates irregularly spaced points
akimaInterpp         Interpolates and smoothes pointwise
krigeInterp          Kriges irregularly spaced data points
linearInterp         Interpolates irregularly spaced points
linearInterpp        Interpolates linearly pointwise
```

Utility Statistics Functions:

```
colStats             Computes sample statistics by col
colSums              Computes sums of values in each col
colMeans             Computes means of values in each col
colSds               Computes standard deviation of each col
colVars              Computes sample variance by col
colSkewness          Computes sample skewness by col
colKurtosis          Computes sample kurtosis by col
colMaxs              Computes maximum values in each col
colMins              Computes minimum values in each col
colProds             Computes product of values in each col
colQuantiles         Computes product of values in each col
```

```
rowStats             Computes sample statistics by row
rowSums              Computes sums of values in each row
rowMeans             Computes means of values in each row
rowSds               Computes standard deviation of each row
rowVars              Computes sample variance by row
rowSkewness          Computes sample skewness by row
rowKurtosis          Computes sample kurtosis by row
rowMaxs              Computes maximum values in each row
rowMins              Computes minimum values in each row
rowProds             Computes product of values in each row
rowQuantiles         Computes product of values in each row
```

3 Financial Return Distributions

Generalized Hyperbolic Distribution:

```
dghReturns           Density for the GH distribution
pghreturns           Probability for the GH distribution
qghreturns           Quantiles for the GH distribution
rghreturns           Random variates for the GH distribution
ghFitFits            Fits parameters of the GH distribution
ghMode               Computes mode of the GH distribution.
ghMean               Returns true mean of the GH distribution
```

ghVar	Returns true variance of the GH distribution
ghSkew	Returns true skewness of the GH distribution
ghKurt	Returns true kurtosis of the GH distribution
ghMoments	Returns true n-th moment of the GH distribution
ghMED	Returns true median of te GH distribution
ghIQR	Returns true inter quartal range of te GH
ghSKEW	Returns true robust skewness of te GH
ghKURT	Returns true robust kurtosis of te GH

Hyperbolic Distribution:

dhyp	Returns density for the HYP distribution
phyp	Returns probability for the HYP distribution
qhyp	Returns quantiles for the HYP distribution
rhyp	Returns random variates for the HYP distribution
hypFit	Fits parameters of the HYP distribution
hypMode	Computes mode of the HYP distribution
hypMean	Returns true mean of the HYP distribution
hypVar R	Returns true variance of the HYP distribution
hypSkew	Returns true skewness of the HYP distribution
hypKurt	Returns true kurtosis of the HYP distribution
hypMoments	Returns true n-th moment of the HYP distribution
hypMED	Returns true median of the HYP distribution
hypIQR	Returns true inter quartal range of the HYP
hypSKEW	Returns true robust skewness of the HYP
hypKURT	Returns true robust kurtosis of the HYP

Normal Inverse Gaussian:

dnig	Returns density for the NIG distribution
pnig	Returns probability for the NIG distribution
qnig	Returns quantiles for the NIG distribution
rnig	Returns random variates for the NIG distribution
.pnigC	fast C Implementation of function pnig()
.qnigC	fast CImplementation of function qnig()
nigFit	Fits parameters of a NIG distribution
.nigFit.mle	Uses max Log-likelihood estimation
.nigFit.gmm	Uses generalized method of moments
.nigFit.mps	Maximum product spacings estimation
.nigFit.vmps	Minimum variance mps estimation
nigMode	Computes mode of the NIG distribution
nigMean	Returns true mean of the NIG distribution
nigVar	Returns true variance of the NIG distribution
nigSkew	Returns true skewness of the NIG distribution
nigKurt	Returns true kurtosis of the NIG distribution
nigMoments	Returns true n-th moment of the NIG distribution

```
nigMED              Returns true median of the NIG distribution
nigIQR              Returns true inter quartal range of the NIG
nigSKEW             Returns true robust skewness of the NIG
nigKURT             Returns true robust kurtosis of the NIG
```

Generalized Hyperbolic Student-t Distribution:

```
dght                Returns density for the GHT distribution
pght                Returns probability for the GHT distribution
qght                Returns quantiles for the GHT distribution
rght                Returns random variates for the GHT distribution
ghtFit              Fits parameters of the GHT distribution
ghtMode             Computes mode of the GHT distribution
ghtMean             Returns true mean of the NIG distribution
ghtVar              Returns true variance of the GHT distribution
ghtSkew             Returns true skewness of the GHT distribution
ghtKurt             Returns true kurtosis of the GHT distribution
ghtMoments          Returns true n-th moment of the GHT distribution
ghtMED              Returns true median of the GHT distribution
ghtIQR              Returns true inter quartal range of the GHT
ghtSKEW             Returns true robust skewness of the GHT
ghtKURT             Returns true robust kurtosis of the GHT
```

Stable Distribution:

```
dstable             Returns density for the stable distribution
pstable             Returns probability for the stable distribution
qstable             Returns quantiles for the stable distribution
rstable             Returns random variates for the dtsble distribution
stableFit           Fits parameters of a the stable distribution
  .phiStable        Creates contour table for McCulloch estimators
  .PhiStable        Contour table created by function .phiStable()
  .qStableFit       Estimates parameters by McCulloch's approach
  .mleStableFit     Estimates stable parameters by MLE approach
  .stablePlot       Plots results of stable parameter estimates
stableMode          Computes mode of the stable distribution
```

Generalized Lambda Distribution:

```
dgld                Returns density for the GLD distribution
pgld                Returns probability for the GLD distribution
qgld                Returns quantiles for the GLD distribution
rgld                Returns random variates for the GLD distribution
gldFit              Fits parameters of the GLD distribution
  .gldFit.mle       fits GLD using maximum log-likelihood
```

```
  .gldFit.mps         fits GLD using maximum product spacings
  .gldFit.gof         fits GLD using Goodness of Fit statistics

  .gldFit.hist        fits GLD using a histogram fit
  .gldFit.rob         fits GLD using robust moments fit
gldMode               Computes mode of the GLD distribution.
gldMED                Returns true median of the GLD distribution
gldIQR                Returns true inter quartal range of the GLD
gldSKEW               Returns true robust skewness of the GLD
gldKURT               Returns true robust kurtosis of the GLD
```

Spline Smoothed Distribution:

```
dssd                  Returns spline smoothed density function
pssd                  Returns spline smoothed probability function
qssd                  Returns spline smoothed quantile function
rssd                  Returns spline smoothed random variates.
ssdFit                Fits parameters for a spline smoothed distribution
```

4 Hypthesis Testing

One Sample Nornality Tests:

```
ksnormTest            One sample Kolmogorov-Smirnov normality test
shapiroTest           Shapiro-Wilk normality test
jarqueberaTest        Jarque-Bera normality test
normalTest            Normality tests S-Plus compatible call
dagoTest              D'Agostino normality test
adTest                Anderson-Darling normality test
cvmTest               Cramer-von Mises normality test
lillieTest            Lilliefors (KS) normality test
pchiTest              Pearson chi-square normality test
sfTest                Shapiro-Francia normality test
jbTest                Finite sample adjusted JB LM and ALM test
```

One Sample Location, Scale and variance Tests:

```
locationTest          Performs locations tests on two samples
  .tTest              Unpaired t test for differences in mean
  .kw2Test            Kruskal-Wallis test for differences in locations
scaleTest             Performs scale tests on two samples
  .ansariTest         Ansari-Bradley test for differences in scale
  .moodTest           Mood test for differences in scale
```

```
varianceTest          Performs variance tests on two samples
  .varfTest           F test for differences in variances
  .bartlett2Test      Bartlett's test for differences in variances
  .fligner2Test       Fligner-Killeen test for differences in variances
```

Two Sample Tests:

```
ks2Test               Performs a two sample Kolmogorov-Smirnov test
correlationTest       Performs correlation tests on two samples
pearsonTest           Pearson product moment correlation coefficient
kendallTest           Kendall's tau correlation test
spearmanTest          Spearman's rho correlation test
```

Test Utilities:

```
'fHTEST'              S4 Class Representation
show.fHTEST           S4 Print Method
  .jbALM              Jarque Bera Augmented Lagrange Multiplier Data
  .jbLM               Jarque-Bera Lagrange Multiplier Data
  .jbTable            Finite sample p values for the Jarque Bera test
  .jbPlot             Plots probabilities
  .pjb                Returns probabilities for JB given quantiles
  .qjb                Returns quantiles for JB given probabilities
```

5 Plotting Routines

Financial Time Series Plots:

```
seriesPlot            Dispalys a time series plot
cumulatedPlot         Displays cumulated series give returns
returnPlot            Displays returns given cumulated series
drawdownPlot          Displays drawdown series from returns
```

Correlation Plots:

```
acfPlot               Displays tailored ACF plot
pacfPlot              Displays tailored partial ACF plot
teffectPlot           Displays the Taylor effect
lacfPlot              Displays lagged autocorrelations
```

Distribution Plots:

```
histPlot              Returns tailored histogram plot
densityPlot           Returns tailored density plot
logDensityPlot        Returns tailored log density plot
boxPlot               Returns side-by-side standard box plot
boxPercentile         Plotreturns box-percentile plot
qqnormPlot            Returns normal quantile-quantile plot
qqnigPlot             Returns NIG quantile-quantile plot
qqghtPlot             Rreturns  GHT quantile-quantile plot
qqgldPlot             Returns GLD quantile-quantile plot
```

Time Series Aggregation Plots:

```
scalinglawPlot        Displays scaling law behavior
```

5. Matrix Computations and Linear Algebra

Elementar Matrix Operation Addons:

```
kron                  Returns the Kronecker product
vec                   Stacks a matrix as column vector
vech                  Stacks a lower triangle matrix
pdl                   Returns regressor matrix for polynomial lags
tslag                 Returns Lagged/leading vector/matrix
```

Linear Algebra Addons:

```
inv                   Returns the inverse of a matrix
norm                  Returns the norm of a matrix
rk                    Returns the rank of a matrix
tr                    Returns the trace of a matrix
```

General Matrix Utility Addons:

```
isPositiveDefinite    Checks if a matrix is positive definite
makePositiveDefinite  Forces a matrix to be positive definite
colVec                Creates a column vector from a data vector
rowVec                Creates a row vector from a data vector
gridVector            Creates from two vectors rectangular grid
triang                Extracs lower tridiagonal part from a matrix
Triang                Extracs upper tridiagonal part from a matrix
```

Selected Matrix Examples:

```
hilbert               Creates a Hilbert matrix
pascal                Creates a Pascal matrix
```

6 Utility Functions

Color Utilities:

colorLocator	Plots Rs 657 named colors for selection
colorMatrix	Returns matrix of R's color names.
colorTable	Table of Color Codes and Plot Colors itself
rainbowPalette	Contiguous rainbow color palette
heatPalette	Contiguous heat color palette
terrainPalette	Contiguous terrain color palette
topoPalette	Contiguous topo color palette
cmPalette	Contiguous cm color palette
greyPalette	R's gamma-corrected gray palette
timPalette	Tim's Matlab like color palette
rampPalette	Color ramp palettes
seqPalette	Sequential color brewer palettes
divPalette	Diverging color brewer palettes
qualiPalette	Qualified color brewer palettes
focusPalette	Red, green blue focus palettes
monoPalette	Red, green blue mono palettes

Graphics Utilities:

symbolTable	Shows a table of plot symbols
characterTable	Shows a table of character codes
decor	Adds horizontal grid and L shaped box
hgrid	Adds horizontal grid lines
vgrid	Adds vertical grid lines
boxL	Adds L-shaped box
box	Adds unterlined box
.xrug	Adds rugs on x axis
.yrug	Adds rugs on y axis
copyright	Adds copyright notice
interactivePlot	Plots several graphs interactively

Special Function Utilities:

Heaviside	Computes Heaviside unit step function
Sign	Another signum function
Delta	Computes delta function
Boxcar	Computes boxcar function
Ramp	Computes ramp function
tsHessian	Computes Two Sided Hessian matrix

Other Utilities:

```
.unirootNA              Computes zero of a function without error exit
getModel                Extracts the model slot from a S4 object
getTitle                Extracts the title slot from a S4 object
getDescription          Extracts the description slot
getSlot                 Extracts a specified slot from a S4 object
```

About Builtin Functions

Builtin functions are borrowed from contributed R packages and other sources. There are several reasons why we have modified and copied code from other sources and included in this package.

* The builtin code is not available on Debian, so that Linux users have no easy acces to this code.

* The original code conflicts with other code from this package or conflicts with Rmetrics design objectives.

* We only need a very small piece of functionality from the original package which may depend on other packages which are not needed.

* The package from which we builtin the code is under current development, so that the functions often change and thus leads to unexpectect behavior in the Rmetrics packages.

* The package may be incompatible since it uses other time date and time series classes than the 'timeDate' and 'timeSeries' objects and methods from Rmetrics.

We put the code in script files named *builtin-funPackage.R* where "fun" denotes the (optional) major function name, and "Package" the name of the contributed package from which we copied the original code.

Builtin functions include:

```
gelGmm                  gll function from gmm package
gmmGMM                  gmm function from gmm package
kweightsSandwhich       kweights from sandwhich package
glGld                   gl functions from gld package
ssdenGss                ssden from the gss package
hypHyperbolicDist       hyp from HyperbolicDist package
```

Compiled Fortran and C Code:

```
gld.c                   source code from gld package
nig.c                   source code from Kersti Aas
gss.f                   source code fromsandwhich package
```

About Rmetrics:

The `fBasics` Rmetrics package is written for educational support in teaching "Computational Finance and Financial Engineering" and licensed under the GPL.

`acfPlot` *Autocorrelation function plots*

Description

Produce plots of the autocorrelation function (ACF), the partial ACF, the lagged ACF, and the Taylor effect plot.

Usage

```
acfPlot(x, labels = TRUE, ...)
pacfPlot(x, labels = TRUE, ...)

lacfPlot(x, n = 12, lag.max = 20, type = c("returns", "values"),
    labels = TRUE, ...)

teffectPlot(x, deltas = seq(from = 0.2, to = 3, by = 0.2), lag.max = 10,
    ymax = NA, standardize = TRUE, labels = TRUE, ...)
```

Arguments

`x`	an uni- or multivariate time series of class `"timeSeries"` or any other object which can be transformed by the function `as.timeSeries()` into an object of class `"timeSeries"`.
`labels`	a logical value, whether or not x- and y-axes should be automatically labeled and a default main title should be added to the plot. By default `TRUE`.
`n`	an integer value, the number of lags.
`lag.max`	maximum lag for which the autocorrelation should be calculated, an integer.
`type`	a character string which specifies the type of the input series, either `"returns"` or `"values"`. In the case of a return series as input, the required value series is computed by cumulating the financial returns: `exp(colCumsums(x))`
`deltas`	the exponents, a numeric vector, by default ranging from 0.2 to 3.0 in steps of 0.2.
`ymax`	maximum y-axis value on plot. If `NA`, then the value is selected automatically.
`standardize`	a logical value. Should the vector `x` be standardized?
`...`	arguments to be passed.

Details

The following plots are described here:

`acfPlot`	autocorrelation function plot,
`pacfPlot`	partial autocorrelation function plot,
`lacfPlot`	lagged autocorrelation function plot,
`teffectPlot`	Taylor effect plot.

Autocorrelation Functions:

The functions `acfPlot` and `pacfPlot`, plot and estimate autocorrelation and partial autocorrelation function. The functions allow to get a first view on correlations within the time series. The functions are synonym function calls for R's `acf` and `pacf` from the the `ts` package.

Taylor Effect:

The "Taylor Effect" describes the fact that absolute returns of speculative assets have significant serial correlation over long lags. Even more, autocorrelations of absolute returns are typically greater than those of squared returns. From these observations the Taylor effect states, that that the autocorrelations of absolute returns to the the power of `delta`, `abs(x-mean(x))^delta` reach their maximum at `delta = 1`. The function `teffect` explores this behaviour. A plot is created which shows for each lag (from 1 to `max.lag`) the autocorrelations as a function of the exponent `delta`. In the case that the above formulated hypothesis is supported, all the curves should peak at the same value around `delta = 1`.

Value

for `acfPlot` and `pacfplot`, an object of class `"acf"`, see `acf`;

for `teffectPlot`, a numeric matrix of order `deltas` by `max.lag` with the values of the autocorrelations;

for `lacfPlot`, a list with the following two elements:

`Rho`	the autocorrelation function,
`lagged`	the lagged correlations.

akimaInterp *Bivariate Spline Interpolation*

Description

Interpolates bivariate data sets using Akima spline interpolation.

Usage

```
akimaInterp(x, y = NULL, z = NULL, gridPoints = 21,
    xo = seq(min(x), max(x), length = gridPoints),
    yo = seq(min(y), max(y), length = gridPoints), extrap = FALSE)

akimaInterpp(x, y = NULL, z = NULL, xo, yo, extrap = FALSE)
```

Arguments

x, y, z	for akimaInterp the arguments x and y are two numeric vectors of grid pounts, and z is a numeric matrix or any other rectangular object which can be transformed by the function as.matrix into a matrix object. For akimaInterpp we consider either three numeric vectors of equal length or if y and z are NULL, a list with entries x, y, z, or named data frame with x in the first, y in the second, and z in the third column.
gridPoints	an integer value specifying the number of grid points in x and y direction.
xo, yo	for akimaInterp two numeric vectors of data points spanning the grid, and for akimaInterpp two numeric vectors of data points building pairs for pointwise interpolation.
extrap	a logical, if TRUE then the data points are extrapolated.

Details

Two options are available: gridded and pointwise interpolation.

akimaInterp is a wrapper to interp provided by the contributed R package akima. The Fortran code of the Akima spline interpolation routine was written by H. Akima.

Linear surface fitting and krige surface fitting are provided by the functions linearInterp and krigeInterp.

Value

akimaInterp returns a list with at least three entries, `x`, `y` and `z`. Note, that the returned values, can be directly used by the `persp` and `contour` 3D plotting methods.

akimaInterpp returns a data.frame with columns `"x"`, `"y"`, and `"z"`.

Note

Package `akima` is no longer needed. Equivalent functions from package `interp` are now called instead.

```
## Does not run for r-solaris-x86
## akimaInterp -- Akima Interpolation:
if (requireNamespace("interp")) {
  set.seed(1953)
  x <- runif(999) - 0.5
  y <- runif(999) - 0.5
  z <- cos(2*pi*(x^2+y^2))
  ans <- akimaInterp(x, y, z, gridPoints = 41, extrap = FALSE)
  persp(ans, theta = -40, phi = 30, col = "steelblue",
       xlab = "x", ylab = "y", zlab = "z")
  contour(ans)
}

## Use spatial as alternative on r-solaris-x86
## spatialInterp - Generate Kriged Grid Data:
if (requireNamespace("spatial")) {
  RNGkind(kind = "Marsaglia-Multicarry", normal.kind = "Inversion")
  set.seed(4711, kind = "Marsaglia-Multicarry")
  x <- runif(999)-0.5
  y <- runif(999)-0.5
  z <- cos(2*pi*(x^2+y^2))
  ans <- krigeInterp(x, y, z, extrap = FALSE)
  persp(ans)
  title(main = "Kriging")
  contour(ans)
  title(main = "Kriging")
}
```

baseMethods *Generic functions extensions*

Description

Basic extensions which add and/or modify additional functionality which is not available in R's basic packages.

Usage

```
## Default S3 method:
stdev(x, na.rm = FALSE)

## Default S3 method:
termPlot(model, ...)
```

Arguments

model	a fitted model object.
x	an object for which to compute the standard deviation.
na.rm	a logical value - should the NA values be removed.
...	arguments to be passed.

Details

stdev and termPlot are generic functions with default methods stats::sd and stats::termplot, respectively.

See Also

sd, termplot

BasicStatistics *Basic time series statistics*

Description

Computes basic financial time series statistics.

Usage

```
basicStats(x, ci = 0.95)
```

Arguments

x	an object of class "timeSeries" or any other object which can be transformed by the function as.timeSeries into an object of class "timeSeries". The latter case, other than "timeSeries" objects, is more or less untested.
ci	confidence interval, a numeric value, by default 0.95, i.e. 95%.

Details

Computes a number of sample statistics for each column of x. The statistics should be clear from the row names of the returned data frame.

"LCL" and "UCL" stand for lower/upper confidence limits, computed under the null hypothesis of i.i.d.

"Kurtosis" represents the *excess kurtosis*, so its theoretical value for the normal distribution is zero, not 3.

These statistics are often computed as a first step in the study of returns on financial assets. In that case any inference on these statistics (including the confidence intervals for the mean) should be considered exploratory, since returns are virtually never i.i.d.

Value

a data frame with one column for each column of x and the following rows:

"nobs"	number of observations,
"NAs"	number of NAs
"Minimum"	minimum,
"Maximum "	maximum,
"1. Quartile"	lower quartile,
"3. Quartile"	upper quartile,
"Mean"	mean,
"Median"	median,
"Sum"	sum of the values,
"SE Mean"	standard error of the mean,
"LCL Mean"	lower limit of the CI for the mean,
"UCL Mean"	upper limit of the CI for the mean,
"Variance"	variance,
"Stdev"	standard deviation,
"Skewness"	skewness coefficient,
"Kurtosis"	excess kurtosis.

Examples

```
## Simulated Monthly Return Data
tS <- timeSeries(matrix(rnorm(12)), timeDate::timeCalendar())
basicStats(tS)
```

BoxPlot *Time series box plots*

Description

Produce a box plot or a box percentile plot.

Usage

```
boxPlot(x, col = "steelblue", title = TRUE, ...)
boxPercentilePlot(x, col = "steelblue", title = TRUE, ...)
```

Arguments

x	an object of class "timeSeries" or any other object which can be transformed by the function as.timeSeries into an object of class "timeSeries".
col	the color for the series. In the univariate case use just a color name like the default, col = "steelblue", in the multivariate case we recommend to select the colors from a color palette, e.g. col = heat.colors(ncol(x)).
title	a logical flag, by default TRUE. Should a default title added to the plot?
...	optional arguments to be passed to boxplot.

Details

boxPlot produces a side-by-side standard box plot,

boxPercentilePlot produces a side-by-side box-percentile plot.

Value

NULL

See Also

seriesPlot, returnPlot, cumulatedPlot, drawdownPlot

qqnormPlot, qqnigPlot, qqghtPlot, qqgldPlot

histPlot, densityPlot, logDensityPlot

acfPlot, pacfPlot, teffectPlot, lacfPlot

scalinglawPlot

returnSeriesGUI

Examples

```
## data
data(LPP2005REC, package = "timeSeries")
LPP <- LPP2005REC[, 1:6]
plot(LPP, type = "l", col = "steelblue", main = "SP500")
abline(h = 0, col = "grey")

boxPlot(LPP)
```

`characterTable` *Table of characters*

Description

Displays a table of numerical equivalents to Latin characters.

Usage

```
characterTable(font = 1, cex = 0.7)
```

Arguments

`cex`	a numeric value, determines the character size, the default size is 0.7.
`font`	an integer value, the number of the `font`, by default font number 1.

Value

displays a table with the characters of the requested font. The character on line `"xy"` and column `"z"` of the table has code `"\xyz"`, e.g `cat("\126")` prints: V for font number 1. These codes can be used as any other characters.

Note

What happens with non-ASCII characters in plots is system dependent and depends on the graphics device, as well. Use of such characters is not recommended for portable code.

See Also

`colorTable`, `symbolTable`

`points` for use of characters in plotting

Examples

```
## Character Table for Font 1:
# characterTable(font = 1)
```

colorLocator *Named colors in R*

Description

Displays R's 657 named colors for selection and returns optionally R's color names.

Usage

```
colorLocator(locator = FALSE, cex.axis = 0.7)
colorMatrix()
```

Arguments

locator	logical, if true, locator is used for interactive selection of color names, default is FALSE.
cex.axis	size of axis labels.

Details

Color Locator:

The colorLocator function plots R's 657 named colors. If locator=TRUE then you can interactively point and click to select the colors for which you want names. To end selection, right click on the mouse and select 'Stop', then R returns the selected color names.

The functions used here are wrappers to the functions provided by Tomas Aragon in the contributed R package epitools.

Value

Color Locator:

colorsLocator() generates a plot with R colors and, when locator is true, returns matrix with graph coordinates and names of colors selected. colorsMatrix() quietly returns the matrix of names.

See Also

colorPalette, colorTable.

Examples

```
colorLocator()
```

colorPalette *Color palettes*

Description

Functions to create color palettes.

The functions are:

rainbowPalette	Contiguous rainbow color palette,
heatPalette	Contiguous heat color palette,
terrainPalette	Contiguous terrain color palette,
topoPalette	Contiguous topo color palette,
cmPalette	Contiguous cm color palette,
greyPalette	R's gamma-corrected gray palette,
timPalette	Tim's Matlab like color palette,
rampPalette	Color ramp palettes,
seqPalette	Sequential color brewer palettes,
divPalette	Diverging color brewer palettes,
qualiPalette	Qualified color brewer palettes,
focusPalette	Red, green blue focus palettes,
monoPalette	Red, green blue mono palettes.

Usage

```
rainbowPalette(n = 64, ...)
heatPalette(n = 64, ...)
terrainPalette(n = 64, ...)
topoPalette(n = 64, ...)
cmPalette(n = 64, ...)

greyPalette(n = 64, ...)
timPalette(n = 64)

rampPalette(n, name = c("blue2red", "green2red", "blue2green",
    "purple2green", "blue2yellow", "cyan2magenta"))

seqPalette(n, name = c(
    "Blues", "BuGn", "BuPu", "GnBu", "Greens", "Greys", "Oranges",
    "OrRd", "PuBu", "PuBuGn", "PuRd", "Purples", "RdPu", "Reds",
    "YlGn", "YlGnBu", "YlOrBr", "YlOrRd"))
divPalette(n, name = c(
    "BrBG", "PiYG", "PRGn", "PuOr", "RdBu", "RdGy", "RdYlBu", "RdYlGn",
    "Spectral"))
qualiPalette(n, name = c(
    "Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2",
```

```
    "Set3"))

focusPalette(n, name = c("redfocus", "greenfocus", "bluefocus"))
monoPalette(n, name = c("redmono", "greenmono", "bluemono"))
```

Arguments

n	an integer, giving the number of greys or colors to be constructed.
name	a character string, the name of the color set.
...	arguments to be passed, see the details section

Details

All Rmetrics' color sets are named as `fooPalette`, where the prefix `foo` denotes the name of the underlying color set.

R's Contiguous Color Palettes::

Palettes for `n` contiguous colors are implemented in the `grDevices` package. To conform with Rmetrics' naming convention for color palettes we have build wrappers around the underlying functions. These are the `rainbowPalette`, `heatPalette`, `terrainPalette`, `topoPalette`, and the `cmPalette`.

Conceptually, all of these functions actually use (parts of) a line cut out of the 3-dimensional color space, parametrized by the function `hsv(h,s,v,gamma)`, where `gamma=1` for the `fooPalette` function, and hence, equispaced hues in RGB space tend to cluster at the red, green and blue primaries.

Some applications, such as contouring, require a palette of colors which do not wrap around to give a final color close to the starting one. To pass additional arguments to the underlying functions see `help(rainbow)`. With rainbow, the parameters `start` and `end` can be used to specify particular subranges of hues. Synonym function calls are `rainbow`, `heat.colors`, `terrain.colors`, `topo.colors`, and `cm.colors`.

R's Gamma-Corrected Gray Palette::

`grayPalette` chooses a series of `n` gamma-corrected gray levels. The range of the gray levels can be optionally monitored through the `...` arguments, for details see `help(gray.colors)`, which is a synonym function call in the `grDevices` package.

Tim's Matlab like Color Palette::

`timPalette` creates a color set ranging from blue to red, and passes through the colors cyan, yellow, and orange. It comes from the Matlab software, originally used in fluid dynamics simulations. The function here is a copy from R's contributed package `fields` doing a spline interpolation on `n=64` color points.

Color Ramp Palettes::

`rampPalette` creates several color ramps. The function is implemented from Tim Keitt's contributed R package `colorRamps`. Supported through the argument `name` are the following color ramps: `"blue2red"`, `"green2red"`, `"blue2green"`, `"purple2green"`, `"blue2yellow"`, `"cyan2magenta"`.

Color Brewer Palettes::

The functions `seqPalette`, `divPalette`, and `qualiPalette` create color sets according to R's contributed `RColorBrewer` package. The first letter in the function name denotes the type of the color set: "s" for sequential palettes, "d" for diverging palettes, and "q" for qualitative palettes.

Sequential palettes are suited to ordered data that progress from low to high. Lightness steps dominate the look of these schemes, with light colors for low data values to dark colors for high data values. The sequential palettes names are: Blues, BuGn, BuPu, GnBu, Greens, Greys, Oranges, OrRd, PuBu, PuBuGn, PuRd, Purples, RdPu, Reds, YlGn, YlGnBu, YlOrBr, YlOrRd.

Diverging palettes put equal emphasis on mid-range critical values and extremes at both ends of the data range. The critical class or break in the middle of the legend is emphasized with light colors and low and high extremes are emphasized with dark colors that have contrasting hues. The diverging palettes names are: BrBG, PiYG, PRGn, PuOr, RdBu, RdGy, RdYlBu, RdYlGn, Spectral.

Qualitative palettes do not imply magnitude differences between legend classes, and hues are used to create the primary visual differences between classes. Qualitative schemes are best suited to representing nominal or categorical data. The qualitative palettes names are: Accent, Dark2, Paired, Pastel1, Pastel2, Set1, Set2, Set3.

In contrast to the original color brewer palettes, the palettes here are created by spline interpolation from the color variation with the most different values, i.e for the sequential palettes these are 9 values, for the diverging palettes these are 11 values, and for the qualitative palettes these are between 8 and 12 values dependeing on the color set.

Graph Color Palettes:

The function `perfanPalette` creates color sets inspired by R's contributed package `Performance Analytics`. These color palettes have been designed to create readable, comparable line and bar graphs with specific objectives.

Focused Color Palettes Color sets designed to provide focus to the data graphed as the first element. This palette is best used when there is clearly an important data set for the viewer to focus on, with the remaining data being secondary, tertiary, etc. Later elements graphed in diminishing values of gray.

Monochrome Color Palettes These include color sets for monochrome color displays.

Value

a character string of color strings

Note

The palettes are wrapper functions provided in several contributed R packages. These include:

Cynthia Brewer and Mark Harrower for the brewer palettes,
Peter Carl and Brian G. Peterson for the "PerformanceAnalytics" package,
Tim Keitt for the "colorRamps" package,
Ross Ihaka for the "colorspace" package,
Tomas Aragon for the "epitools" package,
Doug Nychka for the "fields" package,
Erich Neuwirth for the "RColorBrewer" package.

Additional undocumented hidden functions:

`.asRGB`	Converts any R color to RGB (red/green/blue),
`.chcode`	Changes from one to another number system,
`.hex.to.dec`	Converts heximal numbers do decimal numbers,
`.dec.to.hex`	Converts decimal numbers do heximal numbers.

Examples

```
greyPalette()
```

`colorTable` *Table of colors*

Description

Displays a table of color codes and plots the colors themselves.

Usage

```
colorTable(cex = 0.7)
```

Arguments

`cex`	a numeric value, determines the character size in the color plot, the default is 0.7.

Value

a table of plot colors with the associated color numbers

See Also

`characterTable`, `symbolTable`

Examples

```
colorTable()
```

colVec *Column and row vectors*

Description

Creates a column or row vector from a numeric vector.

Usage

```
colVec(x)
rowVec(x)
```

Arguments

x	a numeric vector.

Details

colVec and rowVec transform a vector into a column and row vector, respectively. A column vector is a matrix object with one column, and a row vector is a matrix object with one row.

Examples

```
x = rnorm(5)

colVec(x)
rowVec(x)
```

correlationTest *Correlation tests*

Description

Tests if two series are correlated.

Usage

```
correlationTest(x, y, method = c("pearson", "kendall", "spearman"),
    title = NULL, description = NULL)

pearsonTest(x, y, title = NULL, description = NULL)
kendallTest(x, y, title = NULL, description = NULL)
spearmanTest(x, y, title = NULL, description = NULL)
```

Arguments

x, y	numeric vectors of data values.
method	a character string naming which test should be applied.
title	an optional title string, if not specified the input's data name is deparsed.
description	optional description string, or a vector of character strings.

Details

These functions test for association/correlation between paired samples based on the Pearson's product moment correlation coefficient (a.k.a. sample correlation), Kendall's tau, and Spearman's rho coefficients.

pearsonTest, kendallTest, and spearmanTest are wrappers of base R's cor.test with simplified interface. They provide 'exact' and approximate p-values for all three alternatives (two-sided, less, and greater), as well as 95% confidence intervals. This is particularly convenient in interactive use.

Instead of calling the individual functions, one can use correlationTest and specify the required test with argument method.

Value

an object from class fHTEST

References

Conover, W. J. (1971); *Practical nonparametric statistics*, New York: John Wiley & Sons.

Lehmann E.L. (1986); *Testing Statistical Hypotheses*, John Wiley and Sons, New York.

See Also

locationTest, scaleTest, varianceTest

Examples

```
x <- rnorm(50)
y <- rnorm(50)

correlationTest(x, y, "pearson")
correlationTest(x, y, "kendall")

spearmanTest(x, y)
```

decor *Functions for decorating plots*

Description

Functions for decorating plots.

Usage

```
decor()

hgrid(ny = NULL, ...)
vgrid(nx = NULL, ...)

boxL(col = "white")
box_(col = c("white", "black"))

copyright()
```

Arguments

col	the color of the background, "black" and foreground "white" lines of the box.
nx, ny	number of cells of the grid in x or y direction. When NULL, as per default, the grid aligns with the tick marks on the corresponding default axis (i.e., tick marks as computed by axTicks).
...	additional arguments passed to the grid() function.

Details

decor is equivalent to hgrid() followed by boxL().

hgrid creates horizontal grid lines.

vgrid creates vertical grid lines.

boxL creates an L-shaped box

box_ creates a bottom line box.

copyright adds Rmetrics copyright to a plot.

Examples

```
plot(x = rnorm(100), type = "l", col = "red",
     xlab = "", ylab = "Variates", las = 1)
title("Normal Deviates", adj = 0)
hgrid()
boxL()
copyright()
```

distCheck *Distribution check*

Description

Tests properties of an R implementation of a distribution, i.e., of all four of its "dpqr" functions.

Usage

```
distCheck(fun = "norm", n = 1000, robust = TRUE, subdivisions = 100, ...)
```

Arguments

fun	a character string, the name of the distribution.
n	an integer specifying the number of random variates to be generated.
robust	logical flag, should robust estimates be used? By default TRUE.
subdivisions	integer specifying the numbers of subdivisions in integration.
...	the distributional parameters.

Examples

```
distCheck("norm", mean = 1, sd = 1)

distCheck("lnorm", meanlog = 0.5, sdlog = 2, robust=FALSE)
## here, true E(X) = exp(mu + 1/2 sigma^2) = exp(.5 + 2) = exp(2.5) = 12.182
## and      Var(X) = exp(2*mu + sigma^2)*(exp(sigma^2) - 1) =       7954.67
```

DistributionFits *Fit normal, Student-t and stable distributions*

Description

A collection of moment and maximum likelihood estimators to fit the parameters of a distribution.

The functions are:

nFit	MLE parameter fit for a normal distribution,
tFit	MLE parameter fit for a Student t-distribution,
stableFit	MLE and Quantile Method stable parameter fit.

Usage

```
nFit(x, doplot = TRUE, span = "auto", title = NULL, description = NULL, ...)

tFit(x, df = 4, doplot = TRUE, span = "auto", trace = FALSE, title = NULL,
    description = NULL, ...)

stableFit(x, alpha = 1.75, beta = 0, gamma = 1, delta = 0,
    type = c("q", "mle"), doplot = TRUE, control = list(),
    trace = FALSE, title = NULL, description = NULL)
```

Arguments

x	a numeric vector.
doplot	a logical flag. Should a plot be displayed?
span	x-coordinates for the plot, by default 100 values automatically selected and ranging between the 0.001, and 0.999 quantiles. Alternatively, you can specify the range by an expression like span=seq(min, max, times = n), where, min and max are the left and right endpoints of the range, and n gives the number of the intermediate points.
control	a list of control parameters, see function nlminb.
alpha, beta, gamma, delta	The parameters are alpha, beta, gamma, and delta: value of the index parameter alpha with alpha = (0,2]; skewness parameter beta, in the range [-1, 1]; scale parameter gamma; and shift parameter delta.
description	a character string which allows for a brief description.
df	the number of degrees of freedom for the Student distribution, df > 2, maybe non-integer. By default a value of 4 is assumed.
title	a character string which allows for a project title.
trace	a logical flag. Should the parameter estimation process be traced?
type	a character string which allows to select the method for parameter estimation: "mle", the maximum log likelihood approach, or "qm", McCulloch's quantile method.
...	parameters to be parsed.

Details

Stable Parameter Estimation:

Estimation techniques based on the quantiles of an empirical sample were first suggested by Fama and Roll [1971]. However their technique was limited to symmetric distributions and suffered from a small asymptotic bias. McCulloch [1986] developed a technique that uses five quantiles from a sample to estimate alpha and beta without asymptotic bias. Unfortunately, the estimators provided by McCulloch have restriction alpha>0.6.

Remark: The parameter estimation for the stable distribution via the maximum Log-Likelihood approach may take a quite long time.

Value

an object from class "fDISTFIT".

Slot fit has components estimate, minimum, code and gradient (but for nFit code is NA and gradient is missing).

Examples

```
set.seed(1953)
s <- rnorm(n = 1000, 0.5, 2)

nFit(s, doplot = TRUE)
```

---

fBasics-deprecated *Deprecated functions in package fBasics*

Description

These functions are provided for compatibility with older versions of the package only, and may be defunct as soon as of the next release.

Details

There are none currently.

dstable, etc., now are defunct, as they have been available from **stabledist** since early 2011.

See Also

Deprecated, Defunct

---

fBasicsData *fBasics data sets*

Description

The following data sets are part of this package:

Capitalization	Market capitalization of domestic companies,
cars2	Data for various car models,
DowJones30	Down Jones 30 stocks,
HedgeFund	Hennessee Hedge Fund Indices,
msft.dat	Daily Microsoft OHLC prices and volume,
nyse	NYSE composite Index,
PensionFund	Swiss Pension Fund LPP-2005,
swissEconomy	Swiss Economic Data,

SWXLP	Swiss Pension Fund LPP-2000,
usdthb	Tick data of USD to THB.

Details

All datasets are data frames. A brief description is given below.

Capitalization:
Capitalization contains market capitalization of 13 domestic companies for 6 years (from 2003 to 2008) in USD millions. Each row contains the data for one company/stock exchange.

cars2:
cars2 contains columns rowNames (model), Price, Country, Reliability, Mileage, (Type), (Weight), Disp. (engine displacement) and HP (net horsepower) reprsenting the indicated properties of 60 car models.

DowJones30:
DowJones30 contains 2529 daily observations from the 'Dow Jones 30' Index series. The first row contains the dates (from 1990-12-31 to 2001-01-02). Each of the remaining thirty columns represents the closing price of a stock in the Index.

HedgeFund:
HedgeFund contains monthly percentage returns of 16 hedge fund strategies from Hennessee Group LLC for year 2005.

msft.dat:
msft.dat contains daily prices (open, high, low and close) and volumes for the Microsoft stocks. It is a data frame with column names "%Y-%m-%d", "Open", "High", "Low", "Close", "Volume".

Note: there is a dataset, MSFT, in package **timeSeries** which contains the same data but is of class "timeSeries".

nyse:
nyse contains daily records of the NYSE Composite Index from 1966-01-04 to 2002-12-31 (9311 observations). The data is in column "NYSE" (second column). The first column contains the dates.

PensionFund:
PensionFund is a daily data set of the Swiss pension fund benchmark LPP-2005. The data set ranges from 2005-11-01 to 2007-04-11. The columns are named: SBI, SPI, SII, LMI, MPI, ALT, LPP25, LPP40, LPP60.

swissEconomy:
swissEconomy contains the GDP per capita (GDPR), exports (EXPO), imports (IMPO), interest rates (INTR), inflation (INFL), unemployment (UNEM) and population (POPU) foryears 1964 to 1999 for Switzerland.

SWXLP:
SWXLP is a daily data set of the Swiss pension fund benchmark LPP-2000. The data set ranges from 2000-01-03 to 2007-05-08 (1917 observations). The first column contains the dates. The remaining columns are named: SBI, SPI, SII, LP25, LP40, LP60.

usdthb:
usdthb Tick data of US Dollar (USD) in Thailand Bhat (THB) collected from Reuters. The date is in the first column in YYYYMMDDhhmm format. The remaining columns contain: delay time (DELAY), contributor (CONTRIBUTOR), bid (BID) and ask (ASK) prices, and quality flag (FLAG). It covers the Asia FX crisis in June 1997.

## Plot DowJones30 Example Data Set
series <- timeSeries::as.timeSeries(DowJones30)
head(series)
plot(series[,1:6], type = "l")

## msft.dat contains (almost?) the same data as MSFT in package timeSeries
data(MSFT, package = "timeSeries")

m1 <- as.matrix(msft.dat[, -1]) # drop date stamps in column 1
m2 <- as.matrix(MSFT)
all.equal(m1, m2, check.attributes = FALSE) # TRUE
## compare the dates:
all.equal(format(msft.dat[ , 1]), format(time(MSFT))) # TRUE
```

fDISTFIT-class *Class* "fDISTFIT"

Description

S4 class representing fitted distributions.

Objects from the Class

Objects can be created by calls of the form `new("fDISTFIT", ...)` but are typically created by functions fitting distributions.

Slots

`call`: Object of class "`call`" ~~

`model`: Object of class "`character`" ~~

`data`: Object of class "`data.frame`" ~~

`fit`: Object of class "`list`" ~~

`title`: Object of class "`character`" ~~

`description`: Object of class "`character`" ~~

Slot `fit` is a list. Its components depend on the fitting functions. Here is the meaning of some common ones:

estimate the point at which the maximum value of the log liklihood function is obtained.

minimum the value of the estimated maximum, i.e. the value of the log liklihood function.

code an integer indicating why the optimization process terminated.
1: relative gradient is close to zero, current iterate is probably solution;
2: successive iterates within tolerance, current iterate is probably solution;
3: last global step failed to locate a point lower than `estimate`. Either `estimate` is an approximate local minimum of the function or `steptol` is too small;
4: iteration limit exceeded;
5: maximum step size `stepmax` exceeded five consecutive times. Either the function is unbounded below, becomes asymptotic to a finite value from above in some direction or `stepmax` is too small.

gradient the gradient at the estimated maximum.

Methods

show `signature(object = "fDISTFIT")`: ...

Examples

```
showClass("fDISTFIT")
```

fHTEST-class *Class* "fHTEST"

Description

An S4 class representing the outcome of a statistical test.

Objects from the Class

Objects from this class are created by some statistical test functions.

Slots

call: the function call.

data: the data as specified by the input argument(s).

test: a list whose elements contain the results from the statistical test. The information provided is similar to a list object of class "htest".

title: a character string with the name of the test. This can be overwritten specifying a user defined input argument.

description: a character string with an optional user defined description. By default just the current date when the test was applied will be returned.

Slot @test is an object of class "list" containing at least the following elements:

statistic the value(s) of the test statistic.

p.value the p-value(s) of the test.

parameters a numeric value or vector of parameters.

estimate a numeric value or vector of sample estimates.

conf.int a numeric two row vector or matrix of 95% confidence levels.

method a character string indicating what type of test was performed.

data.name a character string giving the name(s) of the data.

Methods

show signature(object = "fHTEST"): ...

See Also

for functions returning objects from class "fHTEST", see scaleTest, correlationTest, ks2Test, locationTest, NormalityTests, varianceTest scaleTest

Examples

```
showClass("fHTEST")
```

getS4 *General S4 Class Extractor Functions*

Description

A collection and description of functions to extract slots from S4 class objects.

The extractor functions are:

getModel	Extracts the model slot from a S4 object,
getTitle	Extracts the title slot from a S4 object,
getDescription	Extracts the description slot from a S4 object,
getSlot	Extracts a specified slot from a S4 object,
getArgs	Shows the arguments of a S4 function.

Since R version 2.14.0, a generic `getCall()` is part of R; for earlier versions, we had provided a simple version for S4 objects.

Usage

```
getModel(object)
getTitle(object)
getDescription(object)

getSlot(object, slotName)

getArgs(f, signature)
```

Arguments

f	a generic function or the character-string name of one.
object	an object of class S4.
signature	the signature of classes to match to the arguments of f
slotName	a character string, the name of the slot to be extracted from the S4 object.

Value

for `getModel`, `getTitle`, `getDescription`, and `getSlot` - the content of the corresponding slot.

for `getArgs` the names of the arguments.

Examples

```
## Example S4 Representation:
## Hyothesis Testing with Control Settings
setClass("hypTest",
         representation(
             call = "call",
             data = "numeric",
             test = "list",
             description = "character")
         )

## Shapiro Wilk Normaility Test
swTest = function(x, description = "") {
    ans = shapiro.test(x)
    class(ans) = "list"
    new("hypTest",
        call = match.call(),
        data = x,
        test = ans,
        description = description)
}
test = swTest(x = rnorm(500), description = "500 RVs")

## Extractor Functions:
isS4(test)
getCall(test)
getDescription(test)

## get arguments
args(returns)
getArgs(returns)
getArgs("returns")
getArgs(returns, "timeSeries")
getArgs("returns", "timeSeries")
```

---

gh *Generalized Hyperbolic Distribution*

Description

Density, distribution function, quantile function and random generation for the generalized hyperbolic distribution.

Usage

```
dgh(x, alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2, log = FALSE)
pgh(q, alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)
qgh(p, alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)
rgh(n, alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)
```

Arguments

x, q	a numeric vector of quantiles.
p	a numeric vector of probabilities.
n	number of observations.
alpha	first shape parameter.
beta	second shape parameter, should in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.
lambda	defines the sublclass, by default $-1/2$.
log	a logical flag by default FALSE. Should labels and a main title drawn to the plot?

Details

dgh gives the density, pgh gives the distribution function, qgh gives the quantile function, and rgh generates random deviates.

The meanings of the parameters correspond to the first parameterization, pm=1, which is the default parameterization for this distribution.

In the second parameterization, pm=2, alpha and beta take the meaning of the shape parameters (usually named) zeta and rho.

In the third parameterization, pm=3, alpha and beta take the meaning of the shape parameters (usually named) xi and chi.

In the fourth parameterization, pm=4, alpha and beta take the meaning of the shape parameters (usually named) a.bar and b.bar.

The generator rgh is based on the GH algorithm given by Scott (2004).

Value

numeric vector

Author(s)

David Scott for code implemented from R's contributed package HyperbolicDist.

Raible S. (2000); *Levy Processes in Finance: Theory, Numerics and Empirical Facts*, PhD Thesis, University of Freiburg, Germany, 161 pages.

Examples

```
## rgh -
   set.seed(1953)
   r = rgh(5000, alpha = 1, beta = 0.3, delta = 1)
   plot(r, type = "l", col = "steelblue",
     main = "gh: alpha=1 beta=0.3 delta=1")

## dgh -
   # Plot empirical density and compare with true density:
   hist(r, n = 25, probability = TRUE, border = "white", col = "steelblue")
   x = seq(-5, 5, 0.25)
   lines(x, dgh(x, alpha = 1, beta = 0.3, delta = 1))

## pgh -
   # Plot df and compare with true df:
   plot(sort(r), (1:5000/5000), main = "Probability", col = "steelblue")
   lines(x, pgh(x, alpha = 1, beta = 0.3, delta = 1))

## qgh -
   # Compute Quantiles:
   qgh(pgh(seq(-5, 5, 1), alpha = 1, beta = 0.3, delta = 1),
     alpha = 1, beta = 0.3, delta = 1)
```

---

ghFit *GH Distribution Fit*

Description

Estimates the distrinbutional parameters for a generalized hyperbolic distribution.

Usage

```
ghFit(x, alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2,
    scale = TRUE, doplot = TRUE, span = "auto", trace = TRUE,
    title = NULL, description = NULL, ...)
```

Arguments

x	a numeric vector.
alpha	first shape parameter.
beta	second shape parameter, should in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.
lambda	defines the sublclass, by default $-1/2$.
scale	a logical flag, by default TRUE. Should the time series be scaled by its standard deviation to achieve a more stable optimization?

doplot	a logical flag. Should a plot be displayed?
span	x-coordinates for the plot, by default 100 values automatically selected and ranging between the 0.001, and 0.999 quantiles. Alternatively, you can specify the range by an expression like span=seq(min, max, times = n), where, min and max are the left and right endpoints of the range, and n gives the number of the intermediate points.
trace	a logical flag. Should the parameter estimation process be traced?
title	a character string which allows for a project title.
description	a character string which allows for a brief description.
...	parameters to be parsed.

Details

The meanings of the parameters correspond to the first parameterization, see gh for further details.

The function nlm is used to minimize the "negative" maximum log-likelihood function. nlm carries out a minimization using a Newton-type algorithm.

Value

an object from class "fDISTFIT". Slot fit is a list, currently with components estimate, minimum and code.

Examples

```
set.seed(1953)
s <- rgh(n = 1000, alpha = 1.5, beta = 0.3, delta = 0.5, mu = -1.0)

ghFit(s, alpha = 1, beta = 0, delta = 1, mu = mean(s), doplot = TRUE, trace = FALSE)
```

---

ghMode *Generalized Hyperbolic Mode*

Description

Computes the mode of the generalized hyperbolic function.

Usage

```
ghMode(alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)
```

Arguments

alpha	first shape parameter.
beta	second shape parameter, should in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.
lambda	defines the sublclass, by default $-1/2$.

Details

The meanings of the parameters correspond to the first parameterization, see gh for further details.

Value

a numeric value, the mode of the generalized hyperbolic distribution

References

Atkinson, A.C. (1982); *The simulation of generalized inverse Gaussian and hyperbolic random variables*, SIAM J. Sci. Stat. Comput. 3, 502–515.

Examples

```
## ghMode -
   ghMode()
```

---

ghMoments *Generalized Hyperbolic Distribution Moments*

Description

Calculates moments of the generalized hyperbolic distribution.

Usage

```
ghMean(alpha=1, beta=0, delta=1, mu=0, lambda=-1/2)
ghVar(alpha=1, beta=0, delta=1, mu=0, lambda=-1/2)
ghSkew(alpha=1, beta=0, delta=1, mu=0, lambda=-1/2)
ghKurt(alpha=1, beta=0, delta=1, mu=0, lambda=-1/2)

ghMoments(order, type = c("raw", "central", "mu"),
    alpha = 1, beta=0, delta=1, mu=0, lambda=-1/2)
```

Arguments

alpha	numeric value, the first shape parameter.
beta	numeric value, the second shape parameter in the range (0, alpha).
delta	numeric value, the scale parameter, must be zero or positive.
mu	numeric value, the location parameter, by default 0.
lambda	numeric value, defines the sublclass, by default $-1/2$.
order	an integer value, the order of the moment.
type	a character value, "raw" gives the moments about zero, "central" gives the central moments about the mean, and "mu" gives the moments about the location parameter mu.

Value

a named numerical value. The name is one of mean, var, skew, or kurt, obtained by dropping the nig prefix from the name of the corresponding function and lowercasing it.

for ghMoments, the name is obtained by paste0("m", order, type).

Author(s)

Diethelm Wuertz

References

Scott, D. J., Wuertz, D. and Tran, T. T. (2008) *Moments of the Generalized Hyperbolic Distribution*. Preprint.

Examples

```
## ghMean -
   ghMean(alpha=1.1, beta=0.1, delta=0.8, mu=-0.3, lambda=1)

## ghKurt -
   ghKurt(alpha=1.1, beta=0.1, delta=0.8, mu=-0.3, lambda=1)

## ghMoments -
   ghMoments(4,
     alpha=1.1, beta=0.1, delta=0.8, mu=-0.3, lambda=1)
   ghMoments(4, "central",
     alpha=1.1, beta=0.1, delta=0.8, mu=-0.3, lambda=1)
```

ghRobMoments *Robust Moments for the GH*

Description

Computes the first four robust moments for the generalized hyperbolic distribution.

Usage

```
ghMED(alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)
ghIQR(alpha= 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)
ghSKEW(alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)
ghKURT(alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)
```

Arguments

alpha	first shape parameter.
beta	second shape parameter, should in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.
lambda	defines the sublclass, by default $-1/2$.

Details

The meanings of the parameters correspond to the first parameterization, see gh for further details.

Value

a named numerical value. The name is one of MED, IQR, SKEW, or KURT, obtained by dropping the gh prefix from the name of the corresponding function.

Author(s)

Diethelm Wuertz.

Examples

```
## ghMED -
   # Median:
   ghMED(alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)

## ghIQR -
   # Inter-quartile Range:
   ghIQR(alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)

## ghSKEW -
   # Robust Skewness:
```

```
   ghSKEW(alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)

## ghKURT -
   # Robust Kurtosis:
   ghKURT(alpha = 1, beta = 0, delta = 1, mu = 0, lambda = -1/2)
```

---

ghSlider *Generalized Hyperbolic Distribution Slider*

Description

Displays interactively the dependence of the generalized hyperbolic distribution on its parameters.

Usage

```
ghSlider()
```

Value

a tcl/tk based graphical user interface.

This is a nice display for educational purposes to investigate the densities and probabilities of the generalized hyperbolic distribution.

Examples

```
## ghSlider -
   # ghSlider()
```

---

ght *Generalized Hyperbolic Student-t distribution*

Description

Density, distribution function, quantile function and random generation for the generalized hyperbolic Student-t distribution.

Usage

```
dght(x, beta = 0.1, delta = 1, mu = 0, nu = 10, log = FALSE)
pght(q, beta = 0.1, delta = 1, mu = 0, nu = 10)
qght(p, beta = 0.1, delta = 1, mu = 0, nu = 10)
rght(n, beta = 0.1, delta = 1, mu = 0, nu = 10)
```

Arguments

x, q	a numeric vector of quantiles.
p	a numeric vector of probabilities.
n	number of observations.
beta	numeric value, the skewness parameter in the range (0, alpha).
delta	numeric value, the scale parameter, must be zero or positive.
mu	numeric value, the location parameter, by default 0.
nu	a numeric value, the number of degrees of freedom. Note, alpha takes the limit of abs(beta), and lambda=-nu/2.
log	a logical, if TRUE, probabilities p are given as log(p).

Details

dght gives the density, pght gives the distribution function, qght gives the quantile function, and rght generates random deviates.

The parameters are as in the first parameterization.

Value

numeric vector

## ght -
   #
```

ghtFit *GHT distribution fit*

Description

Estimates the distributional parameters for a generalized hyperbolic Student-t distribution.

Usage

```
ghtFit(x, beta = 0.1, delta = 1, mu = 0, nu = 10,
    scale = TRUE, doplot = TRUE, span = "auto", trace = TRUE,
    title = NULL, description = NULL, ...)
```

Arguments

beta, delta, mu	numeric values. beta is the skewness parameter in the range (0, alpha); delta is the scale parameter, must be zero or positive; mu is the location parameter, by default 0. These are the parameters in the first parameterization.
nu	defines the number of degrees of freedom. Note, alpha takes the limit of abs(beta), and lambda=-nu/2.
x	a numeric vector.
scale	a logical flag, by default TRUE. Should the time series be scaled by its standard deviation to achieve a more stable optimization?
doplot	a logical flag. Should a plot be displayed?
span	x-coordinates for the plot, by default 100 values automatically selected and ranging between the 0.001, and 0.999 quantiles. Alternatively, you can specify the range by an expression like span=seq(min, max, times = n), where, min and max are the left and right endpoints of the range, and n gives the number of the intermediate points.
trace	a logical flag. Should the parameter estimation process be traced?
title	a character string which allows for a project title.
description	a character string which allows for a brief description.
...	parameters to be parsed.

Details

The function nlm is used to minimize the "negative" log-likelihood function. nlm carries out a minimization using a Newton-type algorithm.

Value

an object from class "fDISTFIT". Slot fit is a list, currently with components estimate, minimum and code.

Examples

```
## ghtFit -
   # Simulate Random Variates:
   set.seed(1953)

## ghtFit -
   # Fit Parameters:
```

---

ghtMode *Generalized Hyperbolic Student-t Mode*

Description

Computes the mode of the generalized hyperbolic Student-t distribution.

Usage

```
ghtMode(beta = 0.1, delta = 1, mu = 0, nu = 10)
```

Arguments

beta	the skewness parameter in the range (0, alpha).
delta	the scale parameter, must be zero or positive.
mu	the location parameter, by default 0.
nu	a numeric value, the number of degrees of freedom. Note, alpha takes the limit of abs(beta), and lambda=-nu/2.

Details

These are the parameters in the first parameterization.

Value

a numeric value, the mode for the generalized hyperbolic Student-t distribution.

Examples

```
## ghtMode -
   ghtMode()
```

---

ghtMoments *Generalized Hyperbolic Student-t Moments*

Description

Calculates moments of the generalized hyperbolic Student-t distribution.

Usage

```
ghtMean(beta=0.1, delta=1, mu=0, nu=10)
ghtVar(beta=0.1, delta=1, mu=0, nu=10)
ghtSkew(beta=0.1, delta=1, mu=0, nu=10)
ghtKurt(beta=0.1, delta=1, mu=0, nu=10)

ghtMoments(order, type = c("raw", "central", "mu"),
    beta=0.1, delta=1, mu=0, nu=10)
```

Arguments

beta	numeric value, the skewness parameter in the range (0, alpha).
delta	numeric value, the scale parameter, must be zero or positive.
mu	numeric value, the location parameter, by default 0.
nu	a numeric value, the number of degrees of freedom. Note, alpha takes the limit of abs(beta), and lambda=-nu/2.
order	an integer value, the order of the moment.
type	a character string, "raw" returns the moments about zero, "central" returns the central moments about the mean, and "mu" returns the moments about the location parameter mu.

Value

a named numerical value. The name is one of mean, var, skew, or kurt, obtained by dropping the nig prefix from the name of the corresponding function and lowercasing it.

for ghtMoments, the name is obtained by paste0("m", order, type).

Examples

```
## ghtMean -
   ghtMean(beta=0.2, delta=1.2, mu=-0.5, nu=4)

## ghtKurt -
   ghtKurt(beta=0.2, delta=1.2, mu=-0.5, nu=4)

## ghtMoments -
   ghtMoments(4,
     beta=0.2, delta=1.2, mu=-0.5, nu=4)
   ghtMoments(4, "central",
     beta=0.2, delta=1.2, mu=-0.5, nu=4)
```

`ghtRobMoments` *Robust Moments for the GHT*

Description

Computes the first four robust moments for the generalized hyperbolic Student-t.

Usage

```
ghtMED(beta = 0.1, delta = 1, mu = 0, nu = 10)
ghtIQR(beta = 0.1, delta = 1, mu = 0, nu = 10)
ghtSKEW(beta = 0.1, delta = 1, mu = 0, nu = 10)
ghtKURT(beta = 0.1, delta = 1, mu = 0, nu = 10)
```

Arguments

`beta`	skewness parameter in the range `(0, alpha)`.
`delta`	scale parameter, must be zero or positive.
`mu`	location parameter, by default 0.
`nu`	a numeric value, the number of degrees of freedom. Note, `alpha` takes the limit of `abs(beta)`, and `lambda=-nu/2`.

Details

The parameters are those of the first parameterization.

Value

a named numerical value. The name is one of `MED`, `IQR`, `SKEW`, or `KURT`, obtained by dropping the `ght` prefix from the name of the corresponding function.

Author(s)

Diethelm Wuertz.

Examples

```
## ghtMED -
   # Median:
   ghtMED(beta = 0.1, delta = 1, mu = 0, nu = 10)

## ghtIQR -

## ghtKURT -
   # Robust Kurtosis:
   ghtKURT(beta = 0.1, delta = 1, mu = 0, nu = 10)
```

---

gld *Generalized Lambda Distribution*

Description

Density, distribution function, quantile function and random generation for the generalized lambda distribution.

Usage

```
dgld(x, lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8, log = FALSE)
pgld(q, lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)
qgld(p, lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)
rgld(n, lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)
```

Arguments

lambda1	location parameter.
lambda2	scale parameter.
lambda3	first shape parameter.
lambda4	second shape parameter.
n	number of observations.
p	a numeric vector of probabilities.
x, q	a numeric vector of quantiles.
log	a logical, if TRUE, probabilities p are given as log(p).

Details

dgld gives the density, pgld gives the distribution function, qgld gives the quantile function, and rgld generates random deviates.

Value

numeric vector

Author(s)

Chong Gu for code implemented from R's contributed package gld.

Examples

```
## rgld -
   set.seed(1953)
   r = rgld(500,
     lambda1=0, lambda2=-1, lambda3=-1/8, lambda4=-1/8)
   plot(r, type = "l", col = "steelblue",
     main = "gld: lambda1=0 lambda2=-1 lambda3/4=-1/8")

## dgld -
   # Plot empirical density and compare with true density:
   hist(r, n = 25, probability = TRUE, border = "white",
     col = "steelblue")
   x = seq(-5, 5, 0.25)
   lines(x, dgld(x,
     lambda1=0, lambda2=-1, lambda3=-1/8, lambda4=-1/8))

## pgld -
   # Plot df and compare with true df:
   plot(sort(r), ((1:500)-0.5)/500, main = "Probability",
     col = "steelblue")
   lines(x, pgld(x,
     lambda1=0, lambda2=-1, lambda3=-1/8, lambda4=-1/8))

## qgld -
   # Compute Quantiles:
   qgld(pgld(seq(-5, 5, 1),
     lambda1=0, lambda2=-1, lambda3=-1/8, lambda4=-1/8),
     lambda1=0, lambda2=-1, lambda3=-1/8, lambda4=-1/8)
```

---

gldFit *GH Distribution Fit*

Description

Estimates the distrinbutional parameters for a generalized lambda distribution.

Usage

```
gldFit(x, lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8,
    method = c("mle", "mps", "gof", "hist", "rob"),
    scale = NA, doplot = TRUE, add = FALSE, span = "auto", trace = TRUE,
    title = NULL, description = NULL, ...)
```

Arguments

x	a numeric vector.
lambda1, lambda2, lambda3, lambda4	are numeric values where lambda1 is the location parameter, lambda2 is the location parameter, lambda3 is the first shape parameter, and lambda4 is the second shape parameter.
method	a character string, the estimation approach to fit the distributional parameters, see details.
scale	not used.
doplot	a logical flag. Should a plot be displayed?
add	a logical flag. Should a new fit added to an existing plot?
span	x-coordinates for the plot, by default 100 values automatically selected and ranging between the 0.001, and 0.999 quantiles. Alternatively, you can specify the range by an expression like span=seq(min, max, times = n), where, min and max are the left and rigldt endpoints of the range, and n gives the number of the intermediate points.
trace	a logical flag. Should the parameter estimation process be traced?
title	a character string which allows for a project title.
description	a character string which allows for a brief description.
...	parameters to be parsed.

Details

The function nlminb is used to minimize the objective function. The following approaches have been implemented:

"mle", maximimum log likelihoo estimation.

"mps", maximum product spacing estimation.

"gof", goodness of fit approaches, type="ad" Anderson-Darling, type="cvm" Cramer-vonMise, type="ks" Kolmogorov-Smirnov.

"hist", histogram binning approaches, "fd" Freedman-Diaconis binning, "scott", Scott histogram binning, "sturges", Sturges histogram binning.

"rob", robust moment matching.

Value

an object from class "fDISTFIT". Slot fit is a list, currently with components estimate, minimum and code.

Examples

```
set.seed(1953)
s <- rgld(n = 1000, lambda1=0, lambda2=-1, lambda3=-1/8, lambda4=-1/8)

gldFit(s, lambda1=0, lambda2=-1, lambda3=-1/8, lambda4=-1/8,
       doplot = TRUE, trace = FALSE)
```

---

gldMode *Generalized Lambda Distribution Mode*

Description

Computes the mode of the generalized lambda distribution.

Usage

```
gldMode(lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)
```

Arguments

lambda1	location parameter.
lambda2	scale parameter.
lambda3	first shape parameter.
lambda4	second shape parameter.

Author(s)

Implemented by Diethelm Wuertz

---

gldRobMoments *Robust Moments for the GLD*

Description

Computes the first four robust moments for the Generalized Lambda Distribution.

Usage

```
gldMED(lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)
gldIQR(lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)
gldSKEW(lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)
gldKURT(lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)
```

Arguments

lambda1	location parameter
lambda2	scale parameter
lambda3	first shape parameter
lambda4	second shape parameter

Value

a named numerical value. The name is one of MED, IQR, SKEW, or KURT, obtained by dropping the gld prefix from the name of the corresponding function.

Author(s)

Diethelm Wuertz.

Examples

```
## gldMED -
   # Median:
   gldMED(lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)

## gldIQR -
   # Inter-quartile Range:
   gldIQR(lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)

## gldSKEW -
   # Robust Skewness:
   gldSKEW(lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)

## gldKURT -
   # Robust Kurtosis:
   gldKURT(lambda1 = 0, lambda2 = -1, lambda3 = -1/8, lambda4 = -1/8)
```

---

gridVector *Grid vector coordinates*

Description

Creates rectangular grid coordinates from two vectors.

Usage

```
gridVector(x, y = NULL)
```

Arguments

x, y	numeric vectors

Details

The grid is obtained by pairing each element of y with all elements of x. The X and Y coordinates of the points are stored in separate vectors. This is convenient, for example, for plotting. It can be useful also for brute force optimisation or simulation.

If y is NULL, the default, then y = x.

Value

a list with two components, X and Y, giving the coordinates which span the bivariate grid.

See Also

expand.grid

Examples

```
## a small grid vector with row and col transformations
gridVector(0:2)
data.frame(gridVector(0:2))
do.call("rbind", gridVector(0:2))

gridVector(0:2, 0:3)

## grid over a unit square
gridVector((0:10)/10) # equivalently: gridVector((0:10)/10, (0:10)/10)
```

Heaviside *Heaviside and related functions*

Description

Functions which compute the Heaviside and related functions. These include the Heaviside function, the sign function, the delta function, the boxcar function, and the ramp function.

Usage

```
Heaviside(x, a = 0)
Sign(x, a = 0)
Delta(x, a = 0)
Boxcar(x, a = 0.5)
Ramp(x, a = 0)
```

Arguments

x	a numeric vector.
a	a numeric value, the location of the break.

Details

`Heaviside` computes the Heaviside unit step function. `Heaviside` is 1 for `x > a`, `1/2` for `x = a`, and `0` for `x < a`.

`Sign` computes the sign function. `Sign` is `1` for `x > a`, `0` for `x = a`, and `-1` for `x < a`.

`Delta` computes the delta function. `Delta` is defined as: `Delta(x) = d/dx H(x-a)`.

`Boxcar` computes the boxcar function. `Boxcar` is defined as: `Boxcar(x) = H(x+a) - H(x-a)`.

`Ramp` computes ramp function. The ramp function is defined as: `Ramp(x) = (x-a) * H(x-a)`.

Value

numeric vector

Note

The Heaviside function is used in the implementation of the skew Normal, Student-t, and Generalized Error distributions, distributions functions which play an important role in modelling GARCH processes.

References

Weisstein W. (2004); *http://mathworld.wolfram.com/HeavisideStepFunction.html*, Mathworld.

`GarchDistribution`, `GarchDistributionFits`

Examples

```
x <- sort(round(c(-1, -0.5, 0, 0.5, 1, 5*rnorm(5)), 2))

h <- Heaviside(x)
s <- Sign(x)
d <- Delta(x)
Pi <- Boxcar(x)
r <- Ramp(x)

cbind(x = x, Step = h, Signum = s, Delta = d, Pi = Pi, R = r)
```

---

hilbert *Hilbert matrix*

Description

Creates a Hilbert matrix.

Usage

```
hilbert(n)
```

Arguments

n	an integer value, the dimension of the square matrix.

Details

An n, n matrix with (i, j)th element equal to $1/(i + j - 1)$ is said to be a Hilbert matrix of order n. Hilbert matrices are symmetric and positive definite.

They are canonical examples of ill-conditioned matrices, making them notoriously difficult to use in numerical computation. For example, the 2-norm condition number of a 5x5 Hilbert matrix above is about 4.8e5.

Value

a matrix

References

Hilbert D., *Collected papers*, vol. II, article 21.

Wilf, H.S., (1970); *Finite Sections of Some Classical Inequalities*, Heidelberg, Springer.

Examples

```
## Create a Hilbert Matrix:
H = hilbert(5)
H
```

HistogramPlot *Histogram and density plots*

Description

Produce tailored histogram plots and kernel density/log-density estimate plots.

Usage

```
histPlot(x, labels = TRUE, col = "steelblue", fit = TRUE,
    title = TRUE, grid = TRUE, rug = TRUE, skip = FALSE, ...)
densityPlot(x, labels = TRUE, col = "steelblue", fit = TRUE, hist = TRUE,
    title = TRUE, grid = TRUE, rug = TRUE, skip = FALSE, ...)
logDensityPlot(x, labels = TRUE, col = "steelblue", robust = TRUE,
    title = TRUE, grid = TRUE, rug = TRUE, skip = FALSE, ...)
```

Arguments

x	an object of class "timeSeries".
labels	a logical flag, should the plot be returned with default labels and decorated in an automated way? By default TRUE.
col	the color for the series. In the univariate case use just a color name like the default, col = "steelblue", in the multivariate case we recommend to select the colors from a color palette, e.g. col = heat.colors(ncol(x)).
fit	a logical flag, should a fit be added to the plot?
hist	a logical flag, by default TRUE. Should a histogram be laid under the plot?
title	a logical flag, by default TRUE. Should a default title be added to the plot?
grid	a logical flag, should a grid be added to the plot? By default TRUE.
rug	a logical flag, by default TRUE. Should a rug representation of the data be added to the plot?
skip	a logical flag, should zeros be skipped in the return Series?
robust	a logical flag, by default TRUE. Should a robust fit be added to the plot?
...	optional arguments to be passed on.

Details

histPlot produces a tailored histogram plot.

densityPlot produces a tailored kernel density estimate plot.

logDensityPlot produces a tailored log kernel density estimate plot.

Value

NULL, invisibly. The functions are used for the side effect of producing a plot.

Examples

```
## data
data(LPP2005REC, package = "timeSeries")
SPI <- LPP2005REC[, "SPI"]
plot(SPI, type = "l", col = "steelblue", main = "SP500")
abline(h = 0, col = "grey")
```

```
histPlot(SPI)

densityPlot(SPI)
```

---

hyp *Hyperbolic distribution*

Description

Density, distribution function, quantile function and random generation for the hyperbolic distribution.

Usage

```
dhyp(x, alpha = 1, beta = 0, delta = 1, mu = 0, pm = 1, log = FALSE)
phyp(q, alpha = 1, beta = 0, delta = 1, mu = 0, pm = 1, ...)
qhyp(p, alpha = 1, beta = 0, delta = 1, mu = 0, pm = 1, ...)
rhyp(n, alpha = 1, beta = 0, delta = 1, mu = 0, pm = 1)
```

Arguments

x, q	numeric vector of quantiles.
p	numeric vector of probabilities.
n	number of observations.
alpha	shape parameter, a positive number. alpha can also be a vector of length four, containing alpha, beta, delta and mu (in that order).
beta	skewness parameter, abs(beta) is in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.
pm	integer number specifying the parameterisation, one of 1, 2, 3, or 4. The default is the first parameterization.
log	a logical value, if TRUE, probabilities p are given as log(p).
...	arguments to be passed to the function integrate.

Details

dhyp gives the density, phyp gives the distribution function, qhyp gives the quantile function, and rhyp generates random deviates.

The meaning of the parameters given above corresponds to the first parameterization, pm = 1, which is the default.

In the second parameterization, pm=2, alpha and beta take the meaning of the shape parameters (usually named) zeta and rho.

In the third parameterization, pm=3, alpha and beta take the meaning of the shape parameters (usually named) xi and chi.

In the fourth parameterization, `pm=4`, `alpha` and `beta` take the meaning of the shape parameters (usually named) `a.bar` and `b.bar`.

The generator `rhyp` is based on the HYP algorithm given by Atkinson (1982).

Value

numeric vector

Author(s)

David Scott for code implemented from R's contributed package **HyperbolicDist**.

Raible S. (2000); *Levy Processes in Finance: Theory, Numerics and Empirical Facts*, PhD Thesis, University of Freiburg, Germany, 161 pages.

Examples

```
## hyp -
   set.seed(1953)
   r = rhyp(5000, alpha = 1, beta = 0.3, delta = 1)
   plot(r, type = "l", col = "steelblue",
     main = "hyp: alpha=1 beta=0.3 delta=1")

## hyp -
   # Plot empirical density and compare with true density:
   hist(r, n = 25, probability = TRUE, border = "white", col = "steelblue")
   x = seq(-5, 5, 0.25)
   lines(x, dhyp(x, alpha = 1, beta = 0.3, delta = 1))

## hyp -
   # Plot df and compare with true df:
   plot(sort(r), (1:5000/5000), main = "Probability", col = "steelblue")
   lines(x, phyp(x, alpha = 1, beta = 0.3, delta = 1))

## hyp -
   # Compute Quantiles:
   qhyp(phyp(seq(-5, 5, 1), alpha = 1, beta = 0.3, delta = 1),
     alpha = 1, beta = 0.3, delta = 1)
```

hypFit *Fit a hyperbolic distribution*

Description

Estimates the parameters of a hyperbolic distribution.

Usage

```
hypFit(x, alpha = 1, beta = 0, delta = 1, mu = 0,
    scale = TRUE, doplot = TRUE, span = "auto", trace = TRUE,
    title = NULL, description = NULL, ...)
```

Arguments

x	a numeric vector.
alpha	shape parameter, a positive number.
beta	skewness parameter, abs(beta) is in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.
scale	a logical flag, by default TRUE. Should the time series be scaled by its standard deviation to achieve a more stable optimization?
doplot	a logical flag. Should a plot be displayed?
span	x-coordinates for the plot, by default 100 values automatically selected and ranging between the 0.001, and 0.999 quantiles. Alternatively, you can specify the range by an expression like span=seq(min, max, times = n), where, min and max are the left and right endpoints of the range, and n gives the number of the intermediate points.
trace	a logical flag. Should the parameter estimation process be traced?
title	a character string which allows for a project title.
description	a character string which allows for a brief description.
...	parameters to be parsed.

Details

The meaning of the parameters given above corresponds to the first parameterization, see dhyp for details.

The function nlm is used to minimize the "negative" maximum log-likelihood function. nlm carries out a minimization using a Newton-type algorithm.

Value

an object from class "fDISTFIT". Slot fit is a list, currently with components estimate, minimum and code.

Examples

```
set.seed(1953)
s <- rhyp(n = 1000, alpha = 1.5, beta = 0.3, delta = 0.5, mu = -1.0)

hypFit(s, alpha = 1, beta = 0, delta = 1, mu = mean(s), doplot = TRUE,
       trace = FALSE)
```

---

hypMode *Hyperbolic mode*

Description

Computes the mode of the hyperbolic distribution.

Usage

```
hypMode(alpha = 1, beta = 0, delta = 1, mu = 0, pm = 1)
```

Arguments

alpha	shape parameter, a positive number. alpha can also be a vector of length four, containing alpha, beta, delta and mu (in that order).
beta	skewness parameter, abs(beta) is in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.
pm	an integer value between 1 and 4 for the selection of the parameterization. The default takes the first parameterization.

Value

a numeric value, the mode in the appropriate parameterization for the hyperbolic distribution.

Author(s)

David Scott for code implemented from R's contributed package HyperbolicDist.

References

Atkinson, A.C. (1982); *The simulation of generalized inverse Gaussian and hyperbolic random variables*, SIAM J. Sci. Stat. Comput. 3, 502–515.

Examples

```
## hypMode -
   hypMode()
```

`hypMoments` *Hyperbolic distribution moments*

Description

Calculates moments of the hyperbolic distribution function.

Usage

```
hypMean(alpha=1, beta=0, delta=1, mu=0)
hypVar(alpha=1, beta=0, delta=1, mu=0)
hypSkew(alpha=1, beta=0, delta=1, mu=0)
hypKurt(alpha=1, beta=0, delta=1, mu=0)

hypMoments(order, type = c("raw", "central", "mu"),
    alpha=1, beta=0, delta=1, mu=0)
```

Arguments

`alpha`	numeric value, the first shape parameter.
`beta`	numeric value, the second shape parameter in the range `(0, alpha)`.
`delta`	numeric value, the scale parameter, must be zero or positive.
`mu`	numeric value, the location parameter, by default 0.
`order`	an integer value, the order of the moment.
`type`	a character string, `"raw"` returns the moments about zero, `"central"` returns the central moments about the mean, and `"mu"` returns the moments about the location parameter `mu`.

Value

a named numerical value. The name is one of `mean`, `var`, `skew`, or `kurt`, obtained by dropping the `hyp` prefix from the name of the corresponding function and lowercasing it.

for `hypMoments`, the name is obtained by `paste0("m", order, type)`.

Author(s)

Diethelm Wuertz

References

Scott, D. J., Wuertz, D. and Tran, T. T. (2008) *Moments of the Generalized Hyperbolic Distribution*. Preprint.

Examples

```
## hypMean -
   hypMean(alpha=1.1, beta=0.1, delta=0.8, mu=-0.3)

## ghKurt -
   hypKurt(alpha=1.1, beta=0.1, delta=0.8, mu=-0.3)

## hypMoments -
   hypMoments(4, alpha=1.1, beta=0.1, delta=0.8, mu=-0.3)
   hypMoments(4, "central", alpha=1.1, beta=0.1, delta=0.8, mu=-0.3)
```

---

hypRobMoments *Robust moments for the HYP*

Description

Computes the first four robust moments for the hyperbolic distribution.

Usage

```
hypMED(alpha = 1, beta = 0, delta = 1, mu = 0)
hypIQR(alpha = 1, beta = 0, delta = 1, mu = 0)
hypSKEW(alpha = 1, beta = 0, delta = 1, mu = 0)
hypKURT(alpha = 1, beta = 0, delta = 1, mu = 0)
```

Arguments

alpha	shape parameter, a positive number. alpha can also be a vector of length four, containing alpha, beta, delta and mu (in that order).
beta	skewness parameter, abs(beta) is in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.

Value

a named numerical value. The name is one of MED, IQR, SKEW, or KURT, obtained by dropping the hyp prefix from the name of the corresponding function.

Author(s)

Diethelm Wuertz

Examples

```
## hypMED -
   # Median:
   hypMED(alpha = 1, beta = 0, delta = 1, mu = 0)

## hypIQR -
   # Inter-quartile Range:
   hypIQR(alpha = 1, beta = 0, delta = 1, mu = 0)

## hypSKEW -
   # Robust Skewness:
   hypSKEW(alpha = 1, beta = 0, delta = 1, mu = 0)

## hypKURT -
   # Robust Kurtosis:
   hypKURT(alpha = 1, beta = 0, delta = 1, mu = 0)
```

---

hypSlider *Hyperbolic distribution slider*

Description

Displays interactively the dependence of the hyperbolic distribution on its parameters.

Usage

```
hypSlider()
```

Value

a tcl/tk based graphical user interface.

This is a nice display for educational purposes to investigate the densities and probabilities of the hyperbolic distribution.

Examples

```
## hypSlider -
   #
```

Ids *Set and retrieve column/row names*

Description

Sets and retrieves column and row names. The functions are for compatibility with SPlus.

Usage

```
colIds(x, ...)
rowIds(x, ...)
```

Arguments

x	a numeric matrix.
...	passed on to colnames or rownames.

Details

Usually in R the functions colnames and rownames are used to retrieve and set the names of matrices. The functions rowIds and colIds, are S-Plus like synonyms.

Examples

```
## Create Pascal Matrix:
P <- pascal(3)
P

rownames(P) <- letters[1:3]
P

colIds(P) <- as.character(1:3)
P
```

interactivePlot *Interactive Plot Utility*

Description

Plots with emphasis on interactive plots.

Usage

```
interactivePlot(x, choices = paste("Plot", 1:9),
    plotFUN = paste("plot.", 1:9, sep = ""), which = "all", ...)
```

Arguments

x	an object to be plotted.
choices	a character vector of length at most 9, giving descriptive names of the plots for the menu presented to the user.
plotFUN	a vector of the same length as choices, containing functions and/or names of functions. plotFUN[[i]] is called to produce the plot corresponding to choice[i].
which	Which graph(s) should be displayed? One of the character strings "ask" (ask the user) or "all" (produce all plots), or a logical vector in which the positions of the TRUE values designate the plots to produce.
...	additional arguments passed to the FUN or plot function. (2023-10-21 GNB: currently the "..." arguments are not really passed on to the plotting functions.)

Details

If which is the character string "ask", then the user is presented with a menu to interactively choose which plot(s) to show. Argument choices is used for the choices in the menu, so they should be informative.

If which is equal to "all" all plots are drawn. If which is a logical vector, the indicated plots are displayed.

Note that if more plots are to be shown in one window, the arrangement should be made in advance (and cleaned up afterwards), see the examples.

par(op)
```

---

inv *The inverse of a matrix*

Description

Computes the inverse of a matrix.

Usage

```
inv(x)
```

Arguments

x	a numeric matrix.

Value

a matrix

References

Golub, van Loan, (1996); *Matrix Computations*, 3rd edition. Johns Hopkins University Press.

Examples

```
## Create Pascal Matrix:
P = pascal(5)
P

## Compute the Inverse Matrix:
inv(P)

## Check:
inv(P) %*% P

## Alternatives:
chol2inv(chol(P))
solve(P)
```

---

krigeInterp *Bivariate Krige Interpolation*

Description

Bivariate Krige Interpolation.

Usage

```
krigeInterp(x, y = NULL, z = NULL, gridPoints = 21,
    xo = seq(min(x), max(x), length = gridPoints),
    yo = seq(min(y), max(y), length = gridPoints),
    extrap = FALSE, polDegree = 6)
```

Arguments

x, y, z	the arguments x and y are two numeric vectors of grid pounts, and z is a numeric matrix or any other rectangular object which can be transformed by the function as.matrix into a matrix object.
gridPoints	an integer value specifying the number of grid points in x and y direction.
xo, yo	two numeric vectors of data points spanning the grid.
extrap	a logical, if TRUE then the data points are extrapolated.
polDegree	the polynomial krige degree, an integer ranging between 1 and 6.

Value

a list with at least three entries, x, y and z. The returned values can be used directly in persp and contour 3D plotting methods.

Note

krigeInterp() requires package **spatial**.

See Also

akimaInterp, linearInterp.

Examples

```
## The akima library is not auto-installed because of a different licence.
## krigeInterp -  Kriging:
set.seed(1953)
x = runif(999) - 0.5
y = runif(999) - 0.5

persp(ans, theta = -40, phi = 30, col = "steelblue",
    xlab = "x", ylab = "y", zlab = "z")
contour(ans)
```

---

kron *Kronecker product*

Description

Computes the Kronecker product of two matrices.

Usage

```
kron(x, y)
```

Arguments

x, y	numeric matrices.

Details

The *Kronecker product* can be computed using the operator %x% or alternatively using the function kron for SPlus compatibility.

Note

kron is a synonym to %x%.

References

Golub, van Loan, (1996); *Matrix Computations*, 3rd edition. Johns Hopkins University Press.

Examples

```
## Create Pascal Matrix:
P = pascal(3)
P

## Return the Kronecker Product
kron(P, diag(3))
P %x% diag(3)
```

`ks2Test` *Two sample Kolmogorov-Smirnov test*

Description

Tests if two series are distributionally equivalent using two sample Kolmogorov-Smirnov test.

Usage

```
ks2Test(x, y, title = NULL, description = NULL)
```

Arguments

`x, y`	numeric vectors of data values.
`title`	an optional title string, if not specified the inputs data name is deparsed.
`description`	optional description string, or a vector of character strings.

Details

The test `ks2Test` performs a Kolmogorov-Smirnov two sample test that the two data samples, `x` and `y`, come from the same distribution, not necessarily a normal distribution. That means that it is not specified what that common distribution is.

`ks2Test` calls several times base R's `ks.test` p-values for all three alternatives (two-sided, less, and greater), as well as the exact p-value for the two-sided case.

Note that the p-values are computed under a hypothesis of i.i.d., which is rarely the case for time series. So, the results should be interpreted cautiosly if that is the case. The same applies when the data are residuals from fitted models.

Value

an object from class `fHTEST`

References

Conover, W. J. (1971); *Practical nonparametric statistics*, New York: John Wiley & Sons.

Lehmann E.L. (1986); *Testing Statistical Hypotheses*, John Wiley and Sons, New York.

Examples

```
x <- rnorm(50)
y <- rnorm(50)

ks2Test(x, y)
```

`lcg` *Generator for Portable random innovations*

Description

Functions to generate portable random innovations. The functions run under R and S-Plus and generate the same sequence of random numbers. Supported are uniform, normal and Student-t distributed random numbers.

The functions are:

`set.lcgseed`	Set initial random seed,
`get.lcgseed`	Get the current valus of the random seed,
`runif.lcg`	Uniform linear congruational generator,
`rnorm.lcg`	Normal linear congruational generator,
`rt.lcg`	Student-t linear congruential generator.

Usage

```
set.lcgseed(seed = 4711)
get.lcgseed()

runif.lcg(n, min = 0, max = 1)
rnorm.lcg(n, mean = 0, sd = 1)
rt.lcg(n, df)
```

Arguments

`seed`	an integer value, the random number seed.
`n`	an integer, the number of random innovations to be generated.
`df`	degrees of freedom, a positive number, may be non-integer.
`mean, sd`	mean and standard deviation of the normally distributed innovations.
`min, max`	lower and upper limits of the uniformly distributed innovations.

Details

A simple portable random number generator for use in R and SPlus. We recommend to use this generator only for comparisons of calculations in R and Splus.

The generator is a linear congruential generator with parameters `LCG(a=13445, c=0, m=2^31-1, X=0)`. It is a simple random number generator which passes the bitwise randomness test.

Value

A vector of generated random innovations. The value of the current seed is stored in the variable `lcg.seed`.

References

Altman, N.S. (1988); *Bitwise Behavior of Random Number Generators*, SIAM J. Sci. Stat. Comput., 9(5), September, 941–949.

Examples

```
set.lcgseed(seed = 65890)

## runif.lcg, rnorm.lcg, rt.lcg
cbind(runif.lcg(10), rnorm.lcg(10), rt.lcg(10, df = 4))

get.lcgseed()

## Note, to overwrite rnorm, use
   # rnorm = rnorm.lcg
   # Going back to rnorm
   # rm(rnorm)
```

---

linearInterp *Bivariate Linear Interpolation*

Description

Bivariate Linear Interpolation. Options are available for gridded and pointwise interpolation.

Usage

```
linearInterp(x, y = NULL, z = NULL, gridPoints = 21,
    xo = seq(min(x), max(x), length = gridPoints),
    yo = seq(min(y), max(y), length = gridPoints))

linearInterpp(x, y = NULL, z = NULL, xo, yo)
```

Arguments

x, y, z	for linearInterp the arguments x and y are two numeric vectors of grid pounts, and z is a numeric matrix or any other rectangular object which can be transformed by the function as.matrix into a matrix object. For linearInterpp we consider either three numeric vectors of equal length or if y and z are NULL, a list with entries x, y, z, or named data frame with x in the first, y in the second, and z in the third column.
gridPoints	an integer value specifying the number of grid points in x and y direction.
xo, yo	for linearInterp two numeric vectors of data points spanning the grid, and for linearInterpp two numeric vectors of data points building pairs for pointwise interpolation.

Value

for linearInterp, a list with at least three entries, x, y and z. The returned values, can be used directly in persp and contour 3D plotting methods.

for linearInterpp, a data.frame with columns "x", "y", and "z".

See Also

akimaInterp and krigeInterp

Examples

```
## Linear Interpolation:
if (requireNamespace("interp")) {
    set.seed(1953)
    x <- runif(999) - 0.5
    y <- runif(999) - 0.5
    z <- cos(2 * pi * (x^2 + y^2))
    ans = linearInterp(x, y, z, gridPoints = 41)
    persp(ans, theta = -40, phi = 30, col = "steelblue",
          xlab = "x", ylab = "y", zlab = "z")
    contour(ans)
}
```

---

listFunctions *List exported functions in a package*

Description

Utilities to list and count exported functions in a package, list the contents of the description file of a package, and

Prints the content of an index file for a package (a list of the objects exported by a package).

Usage

```
listFunctions(package, character.only = FALSE)
countFunctions(package, character.only = FALSE)

listIndex(package, character.only = FALSE)
```

Arguments

package	a literal character string or a character string denoting the name of a package.
character.only	a logical indicating whether 'package' can be assumed to be a character string.

Value

for `listFunctions`, a character vector containing the names of the exported functions in a package,

for `countFunctions`, a named numeric value giving the number of the exported functions in a package.

`listIndex` doesn't return a useful value. It is used for the side effect of printing the description or index.

Note

Be aware that `listFunctions` and `countFunctions` attach the package to the search path.

See Also

`packageDescription`

Examples

```
listFunctions("fBasics")

countFunctions("fBasics")
```

---

locationTest *Two sample location tests*

Description

Tests if two series differ in their distributional location parameter.

Usage

```
locationTest(x, y, method = c("t", "kw2"), title = NULL,
    description = NULL)
```

Arguments

x, y	numeric vectors of data values.
method	a character string naming which test should be applied.
title	an optional title string, if not specified the input's data name is deparsed.
description	optional description string, or a vector of character strings.

Details

The method = "t" can be used to determine if the two sample means are equal for unpaired data sets. Two variants are used, assuming equal or unequal variances.

The method = "kw2" performs a Kruskal-Wallis rank sum test of the null hypothesis that the central tendencies or medians of two samples are the same. The alternative is that they differ. Note, that it is not assumed that the two samples are drawn from the same distribution. It is also worth to know that the test assumes that the variables under consideration have underlying continuous distributions.

Value

an object from class fHTEST

Note

Some of the test implementations are selected from R's ctest package.

Author(s)

R-core team for hypothesis tests implemented from R's package ctest.

References

Conover, W. J. (1971); *Practical nonparametric statistics*, New York: John Wiley & Sons.

Lehmann E.L. (1986); *Testing Statistical Hypotheses*, John Wiley and Sons, New York.

Examples

```
x <- rnorm(50)
y <- rnorm(50)

locationTest(x, y, "t")
locationTest(x, y, "kw2")
```

maxdd *Drawdown statistics*

Description

A collection of functions which compute drawdown statistics. Included are density, distribution function, and random generation for the maximum drawdown distribution. In addition the expectation of drawdowns for Brownian motion can be computed.

Usage

```
dmaxdd(x, sd = 1, horizon = 100, N = 1000)
pmaxdd(q, sd = 1, horizon = 100, N = 1000)
rmaxdd(n, mean = 0, sd = 1, horizon = 100)

maxddStats(mean = 0, sd = 1, horizon = 1000)
```

Arguments

x, q	a numeric vector of quantiles.
n	an integer value, the number of observations.
mean, sd	two numeric values, the mean and standard deviation.
horizon	an integer value, the (run time) horizon of the investor.
N	an integer value, the precession index for summations. Before you change this value please inspect Magdon-Ismail et. al. (2003).

Details

dmaxdd computes the density function of the maximum drawdown distribution. pmaxdd computes the distribution function. rmaxdd generates random numbers from that distribution. maxddStats computes the expectation of drawdowns.

dmaxdd returns for a trendless Brownian process mean=0 and standard deviation "sd" the density from the probability that the maximum drawdown "D" is larger or equal to "h" in the interval [0,T], where "T" denotes the time horizon of the investor.

pmaxdd returns for a trendless Brownian process mean=0 and standard deviation "sd" the probability that the maximum drawdown "D" is larger or equal to "h" in the interval [0,T], where "T" denotes the time horizon of the investor.

rmaxdd returns for a Brownian Motion process with mean mean and standard deviation sd random variates of maximum drawdowns.

maxddStats returns the expected value, E[D], of maximum drawdowns of Brownian Motion for a given drift mean, variance sd, and runtime horizon of the Brownian Motion process.

Note

Currrently, only the driftless case is implemented.

References

Examples

```
## rmaxdd
## Set a random seed
set.seed(1953)
## horizon of the investor, time T
horizon <- 1000
## number of MC samples, N -> infinity
samples <- 1000
## Range of expected Drawdons
xlim <- c(0, 5) * sqrt(horizon)

## Plot Histogram of Simulated Max Drawdowns:
r <- rmaxdd(n = samples, mean = 0, sd = 1, horizon = horizon)
hist(x = r, n = 40, probability = TRUE, xlim = xlim,
     col = "steelblue4", border = "white", main = "Max. Drawdown Density")
points(r, rep(0, samples), pch = 20, col = "orange", cex = 0.7)

## dmaxdd
x <- seq(0, xlim[2], length = 200)
d <- dmaxdd(x = x, sd = 1, horizon = horizon, N = 1000)
lines(x, d, lwd = 2)

## pmaxdd
## Count Frequencies of Drawdowns Greater or Equal to "h":
n <- 50
x <- seq(0, xlim[2], length = n)
g <- rep(0, times = n)
for (i in 1:n)
    g[i] <- length (r[r > x[i]]) / samples

plot(x, g, type ="h", lwd = 3,
     xlab = "q", main = "Max. Drawdown Probability")
## Compare with True Probability "G_D(h)":
x <- seq(0, xlim[2], length = 5*n)
p <- pmaxdd(q = x, sd = 1, horizon = horizon, N = 5000)
lines(x, p, lwd = 2, col="steelblue4")

## maxddStats
## Compute expectation Value E[D]:
maxddStats(mean = -0.5, sd = 1, horizon = 10^(1:4))
maxddStats(mean =  0.0, sd = 1, horizon = 10^(1:4))
maxddStats(mean =  0.5, sd = 1, horizon = 10^(1:4))
```

---

nig *Normal Inverse Gaussian Distribution*

Description

Density, distribution function, quantile function and random generation for the normal inverse Gaussian distribution.

Usage

```
dnig(x, alpha = 1, beta = 0, delta = 1, mu = 0, log = FALSE)
pnig(q, alpha = 1, beta = 0, delta = 1, mu = 0)
qnig(p, alpha = 1, beta = 0, delta = 1, mu = 0)
rnig(n, alpha = 1, beta = 0, delta = 1, mu = 0)
```

Arguments

x, q	a numeric vector of quantiles.
p	a numeric vector of probabilities.
n	number of observations.
alpha	shape parameter.
beta	skewness parameter beta, abs(beta) is in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.
log	a logical flag by default FALSE. Should labels and a main title be drawn to the plot?

Details

dnig gives the density. pnig gives the distribution function. qnig gives the quantile function, and rnig generates random deviates.

The parameters alpha, beta, delta, mu are in the first parameterization of the distribution.

The random deviates are calculated with the method described by Raible (2000).

Value

numeric vector

Author(s)

David Scott for code implemented from R's contributed package HyperbolicDist.

Raible S. (2000); *Levy Processes in Finance: Theory, Numerics and Empirical Facts*, PhD Thesis, University of Freiburg, Germany, 161 pages.

Examples

```
## nig -
   set.seed(1953)
   r = rnig(5000, alpha = 1, beta = 0.3, delta = 1)
   plot(r, type = "l", col = "steelblue",
     main = "nig: alpha=1 beta=0.3 delta=1")

## nig -
   # Plot empirical density and compare with true density:
   hist(r, n = 25, probability = TRUE, border = "white", col = "steelblue")
   x = seq(-5, 5, 0.25)
   lines(x, dnig(x, alpha = 1, beta = 0.3, delta = 1))

## nig -
   # Plot df and compare with true df:
   plot(sort(r), (1:5000/5000), main = "Probability", col = "steelblue")
   lines(x, pnig(x, alpha = 1, beta = 0.3, delta = 1))

## nig -
   # Compute Quantiles:
   qnig(pnig(seq(-5, 5, 1), alpha = 1, beta = 0.3, delta = 1),
     alpha = 1, beta = 0.3, delta = 1)
```

`nigFit` *Fit of a Normal Inverse Gaussian Distribution*

Description

Estimates the parameters of a normal inverse Gaussian distribution.

Usage

```
nigFit(x, alpha = 1, beta = 0, delta = 1, mu = 0,
    method = c("mle", "gmm", "mps", "vmps"), scale = TRUE, doplot = TRUE,
    span = "auto", trace = TRUE, title = NULL, description = NULL, ...)
```

Arguments

`alpha`, `beta`, `delta`, `mu`

The parameters are `alpha`, `beta`, `delta`, and `mu`:
shape parameter `alpha`; skewness parameter `beta`, `abs(beta)` is in the range (0, alpha); scale parameter `delta`, `delta` must be zero or positive; location parameter `mu`, by default 0. These is the meaning of the parameters in the first parameterization `pm=1` which is the default parameterization selection. In the second parameterization, `pm=2` `alpha` and `beta` take the meaning of the shape

parameters (usually named) zeta and rho. In the third parameterization, pm=3 alpha and beta take the meaning of the shape parameters (usually named) xi and chi. In the fourth parameterization, pm=4 alpha and beta take the meaning of the shape parameters (usually named) a.bar and b.bar.

description — a character string which allows for a brief description.

doplot — a logical flag. Should a plot be displayed?

method — a character string. Either "mle", Maximum Likelihood Estimation, the default, "gmm" Gemeralized Method of Moments Estimation, "mps" Maximum Product Spacings Estimation, or "vmps" Minimum Variance Product Spacings Estimation.

scale — a logical flag, by default TRUE. Should the time series be scaled by its standard deviation to achieve a more stable optimization?

span — x-coordinates for the plot, by default 100 values automatically selected and ranging between the 0.001, and 0.999 quantiles. Alternatively, you can specify the range by an expression like span=seq(min, max, times = n), where, min and max are the left and right endpoints of the range, and n gives the number of the intermediate points.

title — a character string which allows for a project title.

trace — a logical flag. Should the parameter estimation process be traced?

x — a numeric vector.

... — parameters to be parsed.

Value

an object from class "fDISTFIT".

Slot fit is a list, whose components depend on the method. See "fDISTFIT" for the meaning of the most common ones.

Here is an **informal** list of components for the various methods:

for mle: par, scale, estimate, minimum, code plus components from nlminb() plus additions from .distStandardErrors();

for gmm: only estimate;

for mps and vmps: estimate, minimum, error (s.e.'s), code.

Examples

```
## Simulate Random Variates
set.seed(1953)
s <- rnig(n = 1000, alpha = 1.5, beta = 0.3, delta = 0.5, mu = -1.0)

nigFit(s, alpha = 1, beta = 0, delta = 1, mu = mean(s), doplot = TRUE,
       trace = FALSE)
```

nigMode *Normal Inverse Gaussian Mode*

Description

Computes the mode of the norm inverse Gaussian distribution.

Usage

```
nigMode(alpha = 1, beta = 0, delta = 1, mu = 0)
```

Arguments

alpha	shape parameter.
beta	skewness parameter beta, abs(beta) is in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.

Value

a numeric value, the mode of the normal inverse Gaussian distribution

References

Examples

```
## nigMode -
   nigMode()
```

nigMoments *Moments for the Normal Inverse Gaussian*

Description

Computes the first four moments for the normal inverse Gaussian distribution.

Usage

```
nigMean(alpha = 1, beta = 0, delta = 1, mu = 0)
nigVar(alpha = 1, beta = 0, delta = 1, mu = 0)
nigSkew(alpha = 1, beta = 0, delta = 1, mu = 0)
nigKurt(alpha = 1, beta = 0, delta = 1, mu = 0)
```

Arguments

alpha	shape parameter.
beta	skewness parameter beta, abs(beta) is in the range (0, alpha).
delta	scale parameter, must be zero or positive.
mu	location parameter, by default 0.

Value

a named numerical value. The name is one of mean, var, skew, or kurt, obtained by dropping the nig prefix from the name of the corresponding function and lowercasing it.

Author(s)

Diethelm Wuertz.

References

Scott, D. J., Wuertz, D. and Tran, T. T. (2008) *Moments of the Generalized Hyperbolic Distribution*. Preprint.

Examples

```
## nigMean -
   # Median:
   nigMean(alpha = 1, beta = 0, delta = 1, mu = 0)

## nigVar -
   # Inter-quartile Range:
   nigVar(alpha = 1, beta = 0, delta = 1, mu = 0)

## nigSKEW -
   # Robust Skewness:
   nigSkew(alpha = 1, beta = 0, delta = 1, mu = 0)
```

```
## nigKurt -
   # Robust Kurtosis:
   nigKurt(alpha = 1, beta = 0, delta = 1, mu = 0)
```

`nigRobMoments` *Robust Moments for the NIG*

Description

Computes the first four robust moments for the Normal Inverse Gaussian Distribution.

Usage

```
nigMED(alpha = 1, beta = 0, delta = 1, mu = 0)
nigIQR(alpha = 1, beta = 0, delta = 1, mu = 0)
nigSKEW(alpha = 1, beta = 0, delta = 1, mu = 0)
nigKURT(alpha = 1, beta = 0, delta = 1, mu = 0)
```

Arguments

`alpha`	shape parameter.
`beta`	skewness parameter `beta`, `abs(beta)` is in the range `(0, alpha)`.
`delta`	scale parameter, must be zero or positive.
`mu`	location parameter, by default 0.

Value

a named numerical value. The name is one of `MED`, `IQR`, `SKEW`, or `KURT`, obtained by dropping the `nig` prefix from the name of the corresponding function.

Author(s)

Diethelm Wuertz.

Examples

```
## nigMED -
   # Median:
   nigMED(alpha = 1, beta = 0, delta = 1, mu = 0)

## nigIQR -
   # Inter-quartile Range:
   nigIQR(alpha = 1, beta = 0, delta = 1, mu = 0)

## nigSKEW -
   # Robust Skewness:
   nigSKEW(alpha = 1, beta = 0, delta = 1, mu = 0)
```

```
## nigKURT -
   # Robust Kurtosis:
   nigKURT(alpha = 1, beta = 0, delta = 1, mu = 0)
```

`nigShapeTriangle` *NIG Shape Triangle*

Description

Plots the normal inverse Gaussian Shape Triangle.

Usage

```
nigShapeTriangle(object, add = FALSE, labels = TRUE, ...)
```

Arguments

`object`	an object of class `"fDISTFIT"` as returned by the function `nigFit`.
`add`	a logical value. Should another point added to the NIG shape triangle? By default FALSE, a new plot will be created.
`labels`	a logical flag by default `TRUE`. Should the logarithm of the density be returned?
`...`	arguments to be passed to the function `integrate`.

Value

displays the parameters of fitted distributions in the NIG shape triangle.

Author(s)

David Scott for code implemented from R's contributed package `HyperbolicDist`.

Examples

```
## nigShapeTriangle -
   #
```

nigSlider *nigerbolic Distribution Slider*

Description

Displays interactively the dependence of the nigerbolic distribution on its parameters.

Usage

```
nigSlider()
```

Value

a tcl/tk based graphical user interface.

This is a nice display for educational purposes to investigate the densities and probabilities of the invetrse Gaussian distribution.

Examples

```
## nigSlider -
   # nigSlider()
```

norm *Matrix norm*

Description

Computes the norm of a matrix.

Usage

```
norm2(x, p = 2)
```

Arguments

x	a numeric matrix.
p	an integer value, 1, 2 or Inf, see section 'Details'.

Details

The function norm2 computes the norm of a matrix. Three choices are possible:

p=1 The maximum absolute column sum norm which is defined as the maximum of the sum of the absolute valued elements of columns of the matrix.

p=2 The spectral norm is "the norm" of a matrix X. This value is computed as the square root of the maximum eigenvalue of CX, where C is the conjugate transpose.

p=Inf The maximum absolute row sum norm is defined as the maximum of the sum of the absolute valued elements of rows of the matrix.

Value

the requested norm of the matrix, a non-negative number

Note

Since `base::norm()` has become available in the R base environment, the function `fBasics::norm()` has become obsolete. To avoid conflicts with `norm()` we have renamed the fBasics' one to `norm2`.

References

Golub, van Loan, (1996); *Matrix Computations*, 3rd edition. Johns Hopkins University Press.

Examples

```
## Create Pascal Matrix:
P <- pascal(5)
P

## Return the Norm of the Matrix:
norm2(P)
```

NormalityTests *Tests for normality*

Description

A collection of functions of one sample tests for testing normality of financial return series.

The functions for testing normality are:

`ksnormTest`	Kolmogorov-Smirnov normality test,
`shapiroTest`	Shapiro-Wilk's test for normality,
`jarqueberaTest`	Jarque-Bera test for normality,
`dagoTest`	D'Agostino normality test.

Functions for high precision Jarque Bera LM and ALM tests:

`jbTest`	Performs finite sample adjusted JB, LM and ALM test.

Additional functions for testing normality from the 'nortest' package:

`adTest`	Anderson–Darling normality test,
`cvmTest`	Cramer–von Mises normality test,
`lillieTest`	Lilliefors (Kolmogorov-Smirnov) normality test,
`pchiTest`	Pearson chi-square normality test,
`sfTest`	Shapiro-Francia normality test.

For SPlus/Finmetrics Compatibility:

`normalTest`	test suite for some normality tests.

Usage

```
ksnormTest(x, title = NULL, description = NULL)

jbTest(x, title = NULL, description = NULL)
shapiroTest(x, title = NULL, description = NULL)
normalTest(x, method = c("sw", "jb"), na.rm = FALSE)

jarqueberaTest(x, title = NULL, description = NULL)
dagoTest(x, title = NULL, description = NULL)

adTest(x, title = NULL, description = NULL)
cvmTest(x, title = NULL, description = NULL)
lillieTest(x, title = NULL, description = NULL)
pchiTest(x, title = NULL, description = NULL)
sfTest(x, title = NULL, description = NULL)
```

Arguments

`x`	a numeric vector of data values or an S4 object of class `"timeSeries"`.
`title`	an optional character string, if not specified the inputs data name is deparsed.
`description`	optional description string, or a vector of character strings.
`method`	for `normalTest` only, indicates one of four different methods for the normality test, one of `"ks"` (Kolmogorov-Smirnov one-sample test, the the default), `"sw"` (Shapiro-Wilk test), `"jb"` (Jarque-Bera Test), and `"da"` (D'Agostino Test).
`na.rm`	for `normalTest` only, a logical value. Should missing values removed before computing the tests? The default value is `FALSE`.

Details

The hypothesis tests may be of interest for many financial and economic applications, especially for the investigation of univariate time series returns.

Several tests for testing if the records from a data set are normally distributed are available. The input to all these functions may be just a vector `x` or a univariate time series object `x` of class `timeSeries`.

First, there exists a wrapper function which allows to call one from two normal tests either the Shapiro–Wilks test or the Jarque–Bera test. This wrapper was introduced for compatibility with S-Plus' FinMetrics package.

Also available are the Kolmogorov–Smirnov one sample test and the D'Agostino normality test.

The remaining five normal tests are the Anderson–Darling test, the Cramer–von Mises test, the Lilliefors (Kolmogorov–Smirnov) test, the Pearson chi–square test, and the Shapiro–Francia test. They are calling functions from R's contributed package `nortest`. The difference to the original

test functions implemented in R and from contributed R packages is that the Rmetrics functions accept time series objects as input and give a more detailed output report.

The Anderson-Darling test is used to test if a sample of data came from a population with a specific distribution, here the normal distribution. The `adTest` goodness-of-fit test can be considered as a modification of the Kolmogorov–Smirnov test which gives more weight to the tails than does the `ksnormTest`.

Note that `jarqueBeraTest` computes the asymptotic statistic and p-value, while `jbTesT` gives final sample approximations.

Value

an object from class `fHTEST`.

Slot `test` is a list containing the following (optionally empty) elements (in addition to those described in `fHTEST`):

ksnormTest the 'D' statistic and p-values for the three alternatives 'two-sided, 'less' and 'greater'.

shapiroTest the 'W' statistic and the p-value.

jarqueberaTest no additional elements.

jbTest the 'Chi-squared' statistic with 2 degrees of freedom and the asymptotic p-value. `jbTest` is the finite sample version of the Jarque Bera Lagrange multiplier, LM, and adjusted Lagrange multiplier test, ALM.

dagoTest the 'Chi-squared', the 'Z3' (Skewness) and 'Z4' (Kurtosis) statistic together with the corresponding p values.

adTest the 'A' statistic and the p-value.

cvmTest the 'W' statistic and the p-value.

lillieTest the 'D' statistic and the p-value.

pchiTest the value for the 'P' statistic and the p-values for the adjusted and not adjusted test cases. In addition the number of classes is printed, taking the default value due to Moore (1986) computed from the expression `n.classes = ceiling(2 * (n^(2/5)))`, where `n` is the number of observations.

sfTest the 'W' statistic and the p-value.

Note

Some of the test implementations are selected from R's `ctest` and `nortest` packages.

Author(s)

R-core team for the tests from R's ctest package,
Adrian Trapletti for the runs test from R's tseries package,
Juergen Gross for the normal tests from R's nortest package,
James Filliben for the Fortran program producing the runs report,
Diethelm Wuertz and Helmut Katzgraber for the finite sample JB tests,
Diethelm Wuertz for the Rmetrics R-port.
Earlier versions of theses functions were based on Fortran code of Paul Johnson.

Examples

```
x <- rnorm(100)

## Kolmogorov-Smirnov one-sampe test
ksnormTest(x)

## Shapiro-Wilk test
shapiroTest(x)

## Jarque-Bera Test
jarqueberaTest(x)
jbTest(x)
```

normRobMoments *Robust moments for the Normal distribution*

Description

Computes the first four robust moments for the Normal distribution.

Usage

```
normMED(mean = 0, sd = 1)
normIQR(mean = 0, sd = 1)
normSKEW(mean = 0, sd = 1)
normKURT(mean = 0, sd = 1)
```

Arguments

mean	locaiton parameter.
sd	scale parameter.

Value

a named numerical value. The name is one of MED, IQR, SKEW, or KURT, obtained by dropping the gh prefix from the name of the corresponding function.

Author(s)

Diethelm Wuertz

Examples

```
## normMED -
   # Median:
   normMED(mean = 0, sd = 1)

## normIQR -
   # Inter-quartile Range:
   normIQR(mean = 0, sd = 1)

## normSKEW -
   # Robust Skewness:
   normSKEW(mean = 0, sd = 1)

## normKURT -
   # Robust Kurtosis:
   normKURT(mean = 0, sd = 1)
```

pascal *Pascal matrix*

Description

Creates a Pascal matrix.

Usage

```
pascal(n)
```

Arguments

n	an integer value, the dimension of the square matrix.

Details

The function pascal generates a Pascal matrix of order n which is a symmetric positive definite matrix with integer entries made up from Pascal's triangle. The determinant of a Pascal matrix is 1. The inverse of a Pascal matrix has integer entries. If lambda is an eigenvalue of a Pascal matrix, then 1/lambda is also an eigenvalue of the matrix. Pascal matrices are ill-conditioned.

Edelman A., Strang G., (2004); *Pascal Matrices*, American Mathematical Monthly 111, 361–385.

Examples

```
## Create Pascal Matrix:
P = pascal(5)
P

## Determinant
det(pascal(5))
det(pascal(10))
det(pascal(15))
det(pascal(20))
```

pdl *Polynomial distributed lags*

Description

Creates a regressor matrix for polynomial distributed lags.

Usage

```
pdl(x, d = 2, q = 3, trim = FALSE)
```

Arguments

x	a numeric vector.
d	an integer specifying the order of the polynomial.
q	an integer specifying the number of lags to use in creating polynomial distributed lags. This must be greater than d.
trim	a logical flag; if TRUE, the missing values at the beginning of the returned matrix will be trimmed.

See Also

tslag

Examples

```
## pdl -
   #
```

positiveDefinite *Positive definite matrices*

Description

Checks if a matrix is positive definite and/or forces a matrix to be positive definite.

Usage

```
isPositiveDefinite(x)
makePositiveDefinite(x)
```

Arguments

x	a square numeric matrix.

Details

The function `isPositiveDefinite` checks if a square matrix is positive definite.

The function `makePositiveDefinite` forces a matrix to be positive definite.

Author(s)

Korbinian Strimmer.

Examples

```
# the 3x3 Pascal Matrix is positive define
isPositiveDefinite(pascal(3))
```

`print` *Print control*

Description

Unlists and prints a control object.

Usage

```
## S3 method for class 'control'
print(x, ...)
```

Arguments

`x`	the object to be printed.
`...`	arguments to be passed.

Value

prints control

Examples

```
control <- list(n = 211, seed = 54, name = "generator")
print(control)
class(control) <- "control"
print(control)
```

QuantileQuantilePlots *Quantile-quantile plots*

Description

Produce quantile-quantile plots for the normal, inverse Gaussian, generalized hyperbolic Student-t and the generalized lambda distributions.

Usage

```
qqnormPlot(x, labels = TRUE, col = "steelblue", pch = 19,
    title = TRUE, mtext = TRUE, grid = FALSE, rug = TRUE,
    scale = TRUE, ...)
qqnigPlot(x, labels = TRUE, col = "steelblue", pch = 19,
    title = TRUE, mtext = TRUE, grid = FALSE, rug = TRUE,
    scale = TRUE, ...)
qqghtPlot(x, labels = TRUE, col = "steelblue", pch = 19,
    title = TRUE, mtext = TRUE, grid = FALSE, rug = TRUE,
    scale = TRUE, ...)
qqgldPlot(x, labels = TRUE, col = "steelblue", pch = 19,
    title = TRUE, mtext = TRUE, grid = FALSE, rug = TRUE,
    scale = TRUE, ...)
```

Arguments

x	an object of class "timeSeries" or any other object which can be transformed by as.timeSeries.
labels	a logical flag, should the plot be returned with default labels and decorated in an automated way? By default TRUE.
col	the color for the series. In the univariate case use just a color name like the default, col = "steelblue", in the multivariate case we recommend to select the colors from a color palette, e.g. col = heat.colors(ncol(x)).
pch	an integer value, by default 19. Which plot character should be used in the plot?
title	a logical flag, by default TRUE. Should a default title be added to the plot?
mtext	a logical flag, by default TRUE. Should a marginal text be printed on the third site of the graph?
grid	a logical flag, should a grid be added to the plot? By default TRUE.
rug	a logical flag, by default TRUE. Should a rug representation of the data be added to the plot?
scale	a logical flag, by default TRUE. Should the plot be for the scaled time series? Used by qqnormPlot only, ignored silently by the others.
...	optional arguments passed to plot().

Details

`qqnormPlot` produces a tailored Normal quantile-quantile plot.

`qqnigPlot` produces a tailored NIG quantile-quantile plot.

`qqghtPlot` produces a tailored GHT quantile-quantile plot.

`qqgldPlot` produces a tailored GLD quantile-quantile plot.

Value

a list containing some of the quantities computed for the plot, invisibly. Currently contains the following components:

x	the quantiles of the reference distribution, used for the x-axis,
y	the (possibly scaled) ordered values of the time series, used for the y-axis.

The list has attribute `"control"` containing the parameters of the fitted distribution.

data(LPP2005REC, package = "timeSeries")
SPI <- LPP2005REC[, "SPI"]
plot(SPI, type = "l", col = "steelblue", main = "SP500")
abline(h = 0, col = "grey")

qqnormPlot(SPI)
```

ReturnSeriesGUI *Return series plots*

Description

A graphical user interface to display finanical time series plots. `returnSeriesGUI` opens a GUI for return series plots.

Usage

```
returnSeriesGUI(x)
```

Arguments

`x`	an object of class `"timeSeries"` or any other object which can be transformed by the function `as.timeSeries` into an object of class `"timeSeries"`.

Value

`NULL`, invisibly. `returnSeriesGUI` is used for the graphical user interface it provides.

Author(s)

Diethelm Wuertz for the Rmetrics R-port

rk *The rank of a matrix*

Description

Computes the rank of a matrix.

Usage

```
rk(x, method = c("qr", "chol"))
```

Arguments

x	a numeric matrix.
method	a character string. For method = "qr" the rank is computed as qr(x)\$rank, or alternatively for method = "chol" the rank is computed as attr(chol(x, pivot = TRUE), "rank").

Details

The function rk computes the rank of a matrix which is the dimension of the range of the matrix corresponding to the number of linearly independent rows or columns of the matrix, or to the number of nonzero singular values.

The rank of a matrix is also named linear map.

References

Golub, van Loan, (1996); *Matrix Computations*, 3rd edition. Johns Hopkins University Press.

Examples

```
## Create Pascal Matrix:
P = pascal(5)
P

## Compute the Rank:
rk(P)
rk(P, "chol")
```

---

rowStats *Row statistics*

Description

Functions to compute row statistical properties of financial and economic time series data.

The functions are:

rowStats	calculates row statistics,
rowSds	calculates row standard deviations,
rowVars	calculates row variances,
rowSkewness	calculates row skewness,
rowKurtosis	calculates row kurtosis,
rowMaxs	calculates maximum values in each row,
rowMins	calculates minimum values in each row,
rowProds	computes product of all values in each row,
rowQuantiles	computes quantiles of each row.

Usage

```
rowStats(x, FUN, ...)

rowSds(x, ...)
rowVars(x, ...)
rowSkewness(x, ...)
rowKurtosis(x, ...)
rowMaxs(x, ...)
rowMins(x, ...)
rowProds(x, ...)
rowQuantiles(x, prob = 0.05, ...)

rowStdevs(x, ...)
rowAvgs(x, ...)
```

Arguments

FUN	a function name, the statistical function to be applied.
prob	a numeric value, the probability with value in [0,1].
x	a rectangular object which can be transformed into a matrix by the function as.matrix.
...	arguments to be passed.

Value

each function returns a numeric vector of the statistics

See Also

apply

Examples

```
## Simulated Return Data in Matrix Form:
x <- matrix(rnorm(10*10), nrow = 10)

rowStats(x, FUN = mean)
rowMaxs(x)
```

---

sampleLMoments *Sample L-moments*

Description

Computes L-moments from an empirical sample data set.

Usage

```
sampleLmoments(x, rmax = 4)
```

Arguments

x	numeric vector, the sample values.
rmax	an integer value, the number of L-moments to be returned.

Value

a named numeric vector of length rmax with names c("L1", "L2", ..., "L<rmax>")

Author(s)

Diethelm Wuertz

Examples

```
x <- rt(100, 4)

sampleLmoments(x)
```

---

sampleRobMoments *Robust moments for the GLD*

Description

Computes the first four robust moments for the Normal Inverse Gaussian Distribution.

Usage

```
sampleMED(x)
sampleIQR(x)
sampleSKEW(x)
sampleKURT(x)
```

Arguments

x	numeric vector, the sample values.

Value

a named numerical value. The name is one of MED, IQR, SKEW, or KURT, obtained by dropping the sample prefix from the name of the corresponding function.

Author(s)

Diethelm Wuertz

Examples

```
## Sample
x <- rt(100, 4)

## Median
sampleMED(x)

## Inter-quartile Range
sampleIQR(x)

## Robust Skewness
sampleSKEW(x)

## Robust Kurtosis
sampleKURT(x)
```

`scaleTest` *Two sample scale tests*

Description

Tests if two series differ in their distributional scale parameter.

Usage

```
scaleTest(x, y, method = c("ansari", "mood"),
    title = NULL, description = NULL)
```

Arguments

`x, y`	numeric vectors of data values.
`method`	a character string naming which test should be applied.
`title`	an optional title string, if not specified the inputs data name is deparsed.
`description`	optional description string, or a vector of character strings.

Details

The `method="ansari"` performs the Ansari-Bradley two-sample test for a difference in scale parameters. The test returns for any sizes of the series `x` and `y` the exact `p` value together with its asymptotic limit.

The `method="mood"`, is another test which performs a two-sample test for a difference in scale parameters. The underlying model is that the two samples are drawn from *f(x-l)* and *f((x-l)/s)/s*, respectively, where *l* is a common location parameter and *s* is a scale parameter. The null hypothesis is *s=1*.

Value

an object from class `fHTEST`

Note

Some of the test implementations are selected from R's `ctest` package.

Author(s)

R-core team for hypothesis tests implemented from R's package `ctest`.

Moore, D.S. (1986); *Tests of the chi-squared type*, In: D'Agostino, R.B. and Stephens, M.A., eds., Goodness-of-Fit Techniques, Marcel Dekker, New York.

Examples

```
## Generate Series:
x = rnorm(50)
y = rnorm(50)

scaleTest(x, y, "ansari")
scaleTest(x, y, "mood")
```

ScalingLawPlot *Scaling law behaviour*

Description

Evaluates the scaling exponent of a financial return series and plots the scaling law.

Usage

```
scalinglawPlot(x, span = ceiling(log(length(x)/252)/log(2)), doplot = TRUE,
    labels = TRUE, trace = TRUE, ...)
```

Arguments

`x`	an uni- or multivariate return series of class `"timeSeries"` or any other object which can be transformed by the function `as.timeSeries()` into an object of class `"timeSeries"`.
`span`	an integer value, determines the plot range. The defaault computes a reasonable number of points for the scaling range, assuming daily data with 252 business days per year.
`doplot`	a logical value. Should a plot be displayed?
`labels`	a logical value. Whether or not x- and y-axes should be automatically labeled and a default main title should be added to the plot. By default `TRUE`.
`trace`	a logical value. Should the computation be traced?
`...`	arguments to be passed to `plot`.

Details

The function `scalinglawPlot` plots the scaling law of financial time series under aggregation and returns an estimate for the scaling exponent. The scaling behavior is a very striking effect of the foreign exchange market and also other markets expressing a regular structure for the volatility. Considering the average absolute return over individual data periods one finds a scaling power law which relates the mean volatility over given time intervals to the size of these intervals. The power law is in many cases valid over several orders of magnitude in time. Its exponent usually deviates significantly from a Gaussian random walk model which implies 1/2.

Value

a list with the following components:

`Intercept`	intercept,
`Exponent`	the scaling exponent,
`InverseExponent`	the inverse of the scaling component.

Author(s)

Diethelm Wuertz for the Rmetrics R-port

References

Taylor S.J. (1986); *Modeling Financial Time Series*, John Wiley and Sons, Chichester.

## Scaling Law Effect
scalinglawPlot(SPI)
```

sgh *Standardized Generalized Hyperbolic Distribution*

Description

Density, distribution function, quantile function and random generation for the standardized generalized hyperbolic distribution.

Usage

```
dsgh(x, zeta = 1, rho = 0, lambda = 1, log = FALSE)
psgh(q, zeta = 1, rho = 0, lambda = 1)
qsgh(p, zeta = 1, rho = 0, lambda = 1)
rsgh(n, zeta = 1, rho = 0, lambda = 1)
```

Arguments

x, q	a numeric vector of quantiles.
p	a numeric vector of probabilities.
n	number of observations.
zeta	shape parameter, a positive number.
rho	skewness parameter, a number in the range $(-1, 1)$.
lambda	??
log	a logical flag by default FALSE. If TRUE, log values are returned.

Details

dsgh gives the density, psgh gives the distribution function, qsgh gives the quantile function, and rsgh generates random deviates.

The generator rsgh is based on the GH algorithm given by Scott (2004).

Value

numeric vector

Author(s)

Diethelm Wuertz

Examples

```
## rsgh -
   set.seed(1953)
   r = rsgh(5000, zeta = 1, rho = 0.5, lambda = 1)
   plot(r, type = "l", col = "steelblue",
     main = "gh: zeta=1 rho=0.5 lambda=1")

## dsgh -
   # Plot empirical density and compare with true density:
   hist(r, n = 50, probability = TRUE, border = "white", col = "steelblue",
     ylim = c(0, 0.6))
   x = seq(-5, 5, length = 501)
   lines(x, dsgh(x, zeta = 1, rho = 0.5, lambda = 1))

## psgh -
   # Plot df and compare with true df:
   plot(sort(r), (1:5000/5000), main = "Probability", col = "steelblue")
   lines(x, psgh(x, zeta = 1, rho = 0.5, lambda = 1))

## qsgh -
   # Compute Quantiles:
   round(qsgh(psgh(seq(-5, 5, 1), zeta = 1, rho = 0.5), zeta = 1, rho = 0.5), 4)
```

`sghFit` *Standardized GH distribution fit*

Description

Estimates the distributional parameters for a standardized generalized hyperbolic distribution.

Usage

```
sghFit(x, zeta = 1, rho = 0, lambda = 1, include.lambda = TRUE,
    scale = TRUE, doplot = TRUE, span = "auto", trace = TRUE,
    title = NULL, description = NULL, ...)
```

Arguments

`x`	a numeric vector.
`zeta`, `rho`, `lambda`	shape parameter `zeta` is positive, skewness parameter `rho` is in the range (-1, 1). and index parameter `lambda`, by default 1.
`include.lambda`	a logical flag, by default `TRUE`. Should the index parameter `lambda` included in the parameter estimate?
`scale`	a logical flag, by default `TRUE`. Should the time series be scaled by its standard deviation to achieve a more stable optimization?
`doplot`	a logical flag. Should a plot be displayed?

span	x-coordinates for the plot, by default 100 values automatically selected and ranging between the 0.001, and 0.999 quantiles. Alternatively, you can specify the range by an expression like span=seq(min, max, times = n), where, min and max are the left and right endpoints of the range, and n gives the number of the intermediate points.
trace	a logical flag. Should the parameter estimation process be traced?
title	a character string which allows for a project title.
description	a character string which allows for a brief description.
...	parameters to be parsed.

Value

an object from class "fDISTFIT". Slot fit is a list, currently with components estimate, minimum, code, param, mean (mean of the original data), var (variance of original data).

Examples

```
set.seed(1953)
s <- rsgh(n = 2000, zeta = 0.7, rho = 0.5, lambda = 0)

sghFit(s, zeta = 1, rho = 0, lambda = 1, include.lambda = TRUE,
       doplot = TRUE, trace = FALSE)
```

---

sght *Standardized generalized hyperbolic Student-t Distribution*

Description

Density, distribution function, quantile function and random generation for the standardized generalized hyperbolic Student-t distribution.

Usage

```
dsght(x, beta = 0.1, delta = 1, mu = 0, nu = 10, log = FALSE)
psght(q, beta = 0.1, delta = 1, mu = 0, nu = 10)
qsght(p, beta = 0.1, delta = 1, mu = 0, nu = 10)
rsght(n, beta = 0.1, delta = 1, mu = 0, nu = 10)
```

Arguments

x, q	a numeric vector of quantiles.
p	a numeric vector of probabilities.
n	number of observations.
beta	numeric value, beta is the skewness parameter in the range (0, alpha).
delta	numeric value, the scale parameter, must be zero or positive.

mu	numeric value, the location parameter, by default 0.
nu	a numeric value, the number of degrees of freedom. Note, alpha takes the limit of abs(beta), and lambda=-nu/2.
log	a logical, if TRUE, probabilities p are given as log(p).

Details

dsght gives the density, psght gives the distribution function, qsght gives the quantile function, and rsght generates random deviates.

These are the parameters in the first parameterization.

Value

numeric vector

Author(s)

Diethelm Wuertz

Examples

```
## rsght -
   set.seed(1953)
   r = rsght(5000, beta = 0.1, delta = 1, mu = 0, nu = 10)
   plot(r, type = "l", col = "steelblue",
     main = "gh: zeta=1 rho=0.5 lambda=1")

## dsght -
   # Plot empirical density and compare with true density:
   hist(r, n = 50, probability = TRUE, border = "white", col = "steelblue")
   x = seq(-5, 5, length = 501)
   lines(x, dsght(x, beta = 0.1, delta = 1, mu = 0, nu = 10))

## psght -
   # Plot df and compare with true df:
   plot(sort(r), (1:5000/5000), main = "Probability", col = "steelblue")
   lines(x, psght(x, beta = 0.1, delta = 1, mu = 0, nu = 10))

## qsght -
   # Compute Quantiles:
   round(qsght(psght(seq(-5, 5, 1), beta = 0.1, delta = 1, mu = 0, nu =10),
               beta = 0.1, delta = 1, mu = 0, nu = 10), 4)
```

snig *Standardized Normal Inverse Gaussian Distribution*

Description

Density, distribution function, quantile function and random generation for the standardized normal inverse Gaussian distribution.

Usage

```
dsnig(x, zeta = 1, rho = 0, log = FALSE)
psnig(q, zeta = 1, rho = 0)
qsnig(p, zeta = 1, rho = 0)
rsnig(n, zeta = 1, rho = 0)
```

Arguments

x, q	a numeric vector of quantiles.
p	a numeric vector of probabilities.
n	number of observations.
zeta	shape parameter zeta is positive.
rho	skewness parameter, a number in the range $(-1, 1)$.
log	a logical flag by default FALSE. If TRUE, log values are returned.

Details

dsnig gives the density, psnig gives the distribution function, qsnig gives the quantile function, and rsnig generates random deviates.

The random deviates are calculated with the method described by Raible (2000).

Value

numeric vector

Author(s)

Diethelm Wuertz

Examples

```
## snig -
   set.seed(1953)
   r = rsnig(5000, zeta = 1, rho = 0.5)
   plot(r, type = "l", col = "steelblue",
     main = "snig: zeta=1 rho=0.5")
```

```
## snig -
   # Plot empirical density and compare with true density:
   hist(r, n = 50, probability = TRUE, border = "white", col = "steelblue")
   x = seq(-5, 5, length = 501)
   lines(x, dsnig(x, zeta = 1, rho = 0.5))

## snig -
   # Plot df and compare with true df:
   plot(sort(r), (1:5000/5000), main = "Probability", col = "steelblue")
   lines(x, psnig(x, zeta = 1, rho = 0.5))

## snig -
   # Compute Quantiles:
   qsnig(psnig(seq(-5, 5, 1), zeta = 1, rho = 0.5), zeta = 1, rho = 0.5)
```

`snigFit` *Fit of a Standardized NIG Distribution*

Description

Estimates the parameters of a standardized normal inverse Gaussian distribution.

Usage

```
snigFit(x, zeta = 1, rho = 0, scale = TRUE, doplot = TRUE,
    span = "auto", trace = TRUE, title = NULL, description = NULL, ...)
```

Arguments

`zeta`, `rho`	shape parameter `zeta` is positive, skewness parameter `rho` is in the range (-1, 1).
`description`	a character string which allows for a brief description.
`doplot`	a logical flag. Should a plot be displayed?
`scale`	a logical flag, by default `TRUE`. Should the time series be scaled by its standard deviation to achieve a more stable optimization?
`span`	x-coordinates for the plot, by default 100 values automatically selected and ranging between the 0.001, and 0.999 quantiles. Alternatively, you can specify the range by an expression like `span=seq(min, max, times = n)`, where, `min` and `max` are the left and right endpoints of the range, and `n` gives the number of the intermediate points.
`title`	a character string which allows for a project title.
`trace`	a logical flag. Should the parameter estimation process be traced?
`x`	a numeric vector.
`...`	parameters to be parsed.

Value

an object from class "fDISTFIT".

Slot fit is a list with the same components as the result from snigFit.

Examples

```
## Simulate Random Variates:
set.seed(1953)
s <- rsnig(n = 2000, zeta = 0.7, rho = 0.5)

## snigFit -
   # Fit Parameters:
   snigFit(s, zeta = 1, rho = 0, doplot = TRUE)
```

---

ssd *Spline Smoothed Distribution*

Description

Density, distribution function, quantile function and random generation from smoothing spline estimates.

Usage

```
dssd(x, param, log = FALSE)
pssd(q, param)
qssd(p, param)
rssd(n, param)
```

Arguments

x, q	a numeric vector of quantiles.
p	a numeric vector of probabilities.
n	number of observations.
param	an object as returned by the function ssdFit.
log	a logical flag by default FALSE. Should labels and a main title drawn to the plot?

Details

dssd gives the density, pssd gives the distribution function, qssd gives the quantile function, and rssd generates random deviates.

Value

numeric vector

Author(s)

Diethelm Wuertz, Chong Gu for the underlying gss package.

Examples

```
## ssdFit -
   set.seed(1953)
   r = rnorm(500)
   hist(r, breaks = "FD", probability = TRUE,
     col = "steelblue", border = "white")

## ssdFit -
   param = ssdFit(r)

## dssd -
   u = seq(min(r), max(r), len = 301)
   v = dssd(u, param)
   lines(u, v, col = "orange", lwd = 2)
```

---

ssdFit *Fit density using smoothing splines*

Description

Estimates the parameters of a density function using smoothing splines.

Usage

```
ssdFit(x)
```

Arguments

x	a numeric vector.

Value

for ssdFit, an object of class ssden. The returned object can be used to evaluate density, probabilities and quantiles.

Author(s)

Diethelm Wuertz, Chong Gu for the underlying gss package.

References

Gu, C. (2002), *Smoothing Spline ANOVA Models*, New York Springer–Verlag.

Examples

```
## ssdFit -
   set.seed(1953)
   r = rnorm(500)
   hist(r, breaks = "FD", probability = TRUE,
     col = "steelblue", border = "white")

## ssdFit -
   param = ssdFit(r)

## dssd -
   u = seq(min(r), max(r), len = 301)
   v = dssd(u, param)
   lines(u, v, col = "orange", lwd = 2)
```

`StableSlider` *Slider GUI for Stable Distribution*

Description

The `stableSlider()` function provides interactive displays of density and probabilities of stable distributions.

Usage

```
stableSlider(col= "steelblue", col.med = "gray30")
```

Arguments

`col`	colour for the density and distributions functions.
`col.med`	colour for the median.

Value

The `stableSlider()` function displays densities and probabilities of the skew stable distribution, for educational purposes.

Author(s)

Diethelm Wuertz for the Rmetrics R-port

symbolTable *Table of symbols*

Description

Displays a table of plot characters and symbols.

Usage

```
symbolTable(font = par('font'), cex = 0.7)
```

Arguments

cex	a numeric value, determines the character size, the default size is 0.7.
font	an integer value, the number of the font, by default font number 1.

Value

displays a table with the plot characters and symbols numbered from 0 to 255 and returns invisibly the name of the font.

Note

Symbols with codes on the range 128-255 are not legitimate in some locales, most notably UTF-8. Moreover, what happens with non-ASCII characters in plots is system dependent and depends on the graphics device, as well. Use of such characters is not recommended for portable code.

From version 4031.95 of package `fBasics`, the characters are always defined as Latin1. In particular, in UTF8 locales the system converts them internally to UTF8. Still some symbols are not usable and non-ASCII symbols are not recommended, as pointed out above. For details, see the help page of `points()`, in particular the discussion of its argument `pch`.

`characterTable`, `colorTable`

`pdf` for discussion of encodings for the pdf device

Examples

```
# symbolTable()
```

TimeSeriesPlots *Financial time series plots*

Description

Produces an index/price, a cumulated return, a return, or a drawdown plot.

Usage

```
seriesPlot(x, labels = TRUE, type = "l", col = "steelblue",
    title = TRUE, grid = TRUE, box = TRUE, rug = TRUE, ...)
cumulatedPlot(x, index = 100, labels = TRUE, type = "l", col = "steelblue",
    title = TRUE, grid = TRUE, box = TRUE, rug = TRUE, ...)
returnPlot(x, labels = TRUE, type = "l", col = "steelblue",
    title = TRUE, grid = TRUE, box = TRUE, rug = TRUE, ...)
drawdownPlot(x, labels = TRUE, type = "l", col = "steelblue",
    title = TRUE, grid = TRUE, box = TRUE, rug = TRUE, ...)
```

Arguments

`x`	an object of class `"timeSeries"` or any other object which can be transformed by `as.timeSeries` into an object of class `"timeSeries"`.
`index`	a numeric value, by default 100. Used by `cumulatedPlot` only. The function cumulates column by column the returns and multiplies the result with the index value: `index * exp(colCumsums(x))`.
`labels`	a logical flag, should the plot be returned with default labels and decorated in an automated way? By default `TRUE`.

type	what type of plot should be drawn? By default we use a line plot, type = "l". An alternative plot style which produces nice figures is for example type = "h".
col	the color for the series. In the univariate case use just a color name like the default, col = "steelblue", in the multivariate case we recommend to select the colors from a color palette, e.g. col = heat.colors(ncol(x)).
title	a logical flag, by default TRUE. Should a default title added to the plot?
grid	a logical flag, should a grid be added to the plot? By default TRUE.
box	a logical flag, should a box be added to the plot? By default TRUE.
rug	a logical flag, by default TRUE. Should a rug representation of the data added to the plot?
...	optional arguments to be passed to plot.

Details

The plot functions can be used to plot univariate and multivariate time series of class timeSeries:

seriesPlot	Returns a tailored return series plot,
cumulatedPlot	Displays a cumulated series given the returns,
returnPlot	Displays returns given the cumulated series,
drawdownPlot	Displays drawdowns given the return series.

The graphical parameters type and col can be set by the values specified through the argument list. In the case of multivariate time series col can be specified by the values returned by a color palette.

Automated titles including main title, x- and y-lables, grid lines, box style and rug represenatations cann be selected by setting these arguments to TRUE which is the default. If the title flag is unset, then the main title, x-, and y-labels are empty strings. This allows to set user defined labels with the function title after the plot is drawn.

Beside type, col, main, xlab and ylab, all other par arguments can be passed to the plot function.

If the labels flag is unset to FALSE, then no decorations will be added to the plot, and the plot can be fully decorated by the user.

Value

NULL (invisibly)

`tr` *Trace of a matrix*

Description

Computes the trace of a matrix.

Usage

```
tr(x)
```

Arguments

`x`	a numeric matrix.

Details

`tr` computes the trace of a square matrix, i.e., the sum of its diagonal elements.

If the matrix is not square, `tr` returns `NA`.

References

Golub, van Loan, (1996); *Matrix Computations*, 3rd edition. Johns Hopkins University Press.

Examples

```
## Create Pascal Matrix:
P = pascal(3)
P

tr(P)
```

`triang` *Upper and lower triangular matrices*

Description

Extracs the upper or lower triangular part from a matrix.

Usage

```
triang(x)
Triang(x)
```

Arguments

`x`	a numeric matrix.

Details

`triang` and `Triang` transform a square matrix to a lower or upper triangular form. The functions just replace the remaining values with zeroes and work with non-square matrices, as well.

A triangular matrix is either an upper triangular matrix or lower triangular matrix. For the first case all matrix elements `a[i,j]` of matrix `A` are zero for `i>j`, whereas in the second case we have just the opposite situation. A lower triangular matrix is sometimes also called left triangular.

In fact, triangular matrices are so useful that much of computational linear algebra begins with factoring or decomposing a general matrix or matrices into triangular form. Some matrix factorization methods are the Cholesky factorization and the LU-factorization. Even including the factorization step, enough later operations are typically avoided to yield an overall time savings.

Triangular matrices have the following properties: the inverse of a triangular matrix is a triangular matrix, the product of two triangular matrices is a triangular matrix, the determinant of a triangular matrix is the product of the diagonal elements, the eigenvalues of a triangular matrix are the diagonal elements.

Value

a matrix of the same dimensions as `x` with the elements above or below the main diagonal set to zeroes

Golub, van Loan, (1996); *Matrix Computations*, 3rd edition. Johns Hopkins University Press.

Examples

```
## Create Pascal Matrix:
P = pascal(3)
P

## Create lower triangle matrix
L = triang(P)
L
```

`tsHessian` *Two sided approximated Hessian*

Description

Computes two sided (TS) approximated Hessian.

Usage

```
tsHessian(x, fun, ...)
```

Arguments

`x`	argument to be passed to `fun`.
`fun`	function.
`...`	additional parameters to be passed to `fun`.

Author(s)

A function borrowed from Kevin Sheppard's Matlab garch toolbox as implemented by Alexios Ghalanos in his **rgarch** package.

`tslag` *Lagged or leading vector/matrix*

Description

Creates a lagged or leading vector/matrix of selected order(s).

Usage

```
tslag(x, k = 1, trim = FALSE)
```

Arguments

k	an integer value, the number of positions the new series is to lag or to lead the input series.
x	a numeric vector or matrix, missing values are allowed.
trim	a logical flag, if TRUE, the missing values at the beginning ans/or end of the returned series will be trimmed. The default value is FALSE.

See Also

pdl

Examples

```
## tslag -
```

---

varianceTest *Two sample variance tests*

Description

Tests if two series differ in their distributional variance parameter.

Usage

```
varianceTest(x, y, method = c("varf", "bartlett", "fligner"),
    title = NULL, description = NULL)
```

Arguments

x, y	numeric vectors of data values.
method	a character string naming which test should be applied.
title	an optional title string, if not specified the inputs data name is deparsed.
description	optional description string, or a vector of character strings.

Details

The `method="varf"` can be used to compare variances of two normal samples performing an F test. The null hypothesis is that the ratio of the variances of the populations from which they were drawn is equal to one.

The `method="bartlett"` performs the Bartlett test of the null hypothesis that the variances in each of the samples are the same. This fact of equal variances across samples is also called *homogeneity of variances*. Note, that Bartlett's test is sensitive to departures from normality. That is, if the samples come from non-normal distributions, then Bartlett's test may simply be testing for non-normality. The Levene test (not yet implemented) is an alternative to the Bartlett test that is less sensitive to departures from normality.

The `method="fligner"` performs the Fligner-Killeen test of the null that the variances in each of the two samples are the same.

Value

an object from class fHTEST

Note

Some of the test implementations are selected from R's ctest package.

Author(s)

R-core team for hypothesis tests implemented from R's package ctest.

References

Conover, W. J. (1971); *Practical nonparametric statistics*, New York: John Wiley & Sons.

Lehmann E.L. (1986); *Testing Statistical Hypotheses*, John Wiley and Sons, New York.

Examples

```
x <- rnorm(50)
y <- rnorm(50)

varianceTest(x, y, "varf")
varianceTest(x, y, "bartlett")
varianceTest(x, y, "fligner")
```

---

vec *Stacking vectors and matrices*

Description

Stacks either a lower triangle matrix or a matrix.

Usage

```
vec(x)
vech(x)
```

Arguments

x	a numeric matrix.

Details

The function vec implements the operator that stacks a matrix as a column vector, to be more precise in a matrix with one column. $vec(X) = (X_{11}, X_{21}, ..., X_{N1}, X_{12}, X_{22}, ..., X_{NN})$.

The function vech implements the operator that stacks the lower triangle of a NxN matrix as an N(N+1)/2x1 vector: $vech(X) = (X_{11}, X_{21}, X_{22}, X_{31}, ..., X_{NN})$, to be more precise in a matrix with one row.

Examples

```
## Create Pascal Matrix:
P = pascal(3)

## Stack the matrix
vec(P)

## Stack the lower triangle
vech(P)
```

`volatility` *Compute volatility*

Description

Generic function for volatility computations.

Usage

```
volatility(object, ...)

## Default S3 method:
volatility(object, ...)
```

Arguments

`object`	an object from which to extract or compute the volatility.
`...`	arguments for methods. Ignored by the default method.

Details

`volatility` is a generic function, whose default method centers and squares the values in `object`. Other packages can (and do) define methods for it.
