

# Package ‘mtdesign’

May 9, 2026

**Type** Package

**Title** Mander and Thompson Designs

**Version** 0.1.4

**Date** 2025-12-22

**Description** Implements Mander & Thompson's (2010)  [<doi:10.1016/j.cct.2010.07.008>](https://doi.org/10.1016/j.cct.2010.07.008) methods for two-stage designs optimal under the alternative hypothesis for phase II [cancer] trials. Also provides an implementation of Simon's (1989)  [<doi:10.1016/0197-2456\(89\)90015-9>](https://doi.org/10.1016/0197-2456(89)90015-9) original methodology and allows exploration of the operating characteristics of sub-optimal designs.

**Language** en-GB

**License** GPL (>= 3)

**Encoding** UTF-8

**URL** <https://github.com/openpharma/mtdesign>

**BugReports** <https://github.com/openpharma/mtdesign/issues>

**RoxygenNote** 7.3.2

**Imports** dplyr, ggplot2, magrittr, methods, Rcpp, rlang, tibble, tidyr

**LinkingTo** Rcpp, BH

**Suggests** parallel, testthat (>= 3.0.0), withr

**Config/testthat/edition** 3

**NeedsCompilation** yes

**Author** John Kirkpatrick [aut, cre] (ORCID:  
 [<https://orcid.org/0000-0001-7790-3708>](https://orcid.org/0000-0001-7790-3708))

**Maintainer** John Kirkpatrick <mtdesign@puzzledface.net>

**Repository** CRAN

**Date/Publication** 2025-12-22 13:20:02 UTC

augmentGrid	<i>Augment a grid of candidate designs with type 1 and type 2 error probabilities, expected sample sizes and probabilities of early termination</i>
-------------	---

---

### Description

Augment a grid of candidate designs with type 1 and type 2 error probabilities, expected sample sizes and probabilities of early termination

### Usage

```
augmentGrid(d, parallel = TRUE, cores = NA, minChunkSize = 1e+05)
```

### Arguments

d	a tibble created by 'createGrid'
parallel	use parallelisation if available
cores	the number of cores to use when parallelising. If <code>NA</code> , all available cores are requested
minChunkSize	The minimum size of the grid before parallelisation is attempted

### Value

an augmented grid tibble

### Usage Notes

Regardless of the value of 'parallel', parallelisation is only used if the size of the grid is greater than `chunkSize`. If parallelisation is requested and needed, an exception is thrown if the parallel package is not available.

### Examples

```
x <- createGrid(p0 = 0.1, p1 = 0.30, alpha = 0.1, beta = 0.1, nMin = 24, nMax = 32) %>%
  augmentGrid(parallel = FALSE)
```

---

createGrid                      *Create a grid of candidate designs*

---

### Description

Create a grid of candidate designs

### Usage

```
createGrid(  
  p0,  
  p1,  
  alpha = 0.1,  
  beta = NA,  
  power = ifelse(is.na(beta), 0.9, 1 - beta),  
  nMin = NA,  
  nMax = NA,  
  mander = TRUE,  
  verbose = FALSE  
)
```

### Arguments

p0	the response rate under the null hypothesis
p1	the response rate under the alternate hypothesis
alpha	the desired (one-sided) type 1 error rate
beta	the desired type 2 error rate
power	an alternative to beta
nMin	the lower bound for the search grid. If NA searchBounds, is called to provide an appropriate value
nMax	the lower bound for the search grid. If NA searchBounds, is called to provide an appropriate value
mander	is a Mander & Thompson or a Simon's design required?
verbose	print messages describing workflow?

### Value

a tibble. See Usage notes for a list and description of columns.

### Examples

```
# Standard use for a Simon's 2-stage design  
x <- createGrid(p0 = 0.1, p1 = 0.5, alpha = 0.1, beta = 0.1, mander = FALSE)  
# Custom search bounds for a Mander & Thompson design  
y <- createGrid(p0 = 0.1, p1 = 0.4, alpha = 0.1, beta = 0.1, nMin = 20, nMax = 30)
```

---

obtainDesign	<i>Finds optimal and minimax designs for either Simon's 2-stage or Mander &amp; Thompson studies</i>
--------------	--

---

### Description

obtainDesign is essentially a wrapper for calls to `createGrid` and `augmentGrid` followed by some simple filtering of the candidate designs to identify the optimal and minimax designs.

### Usage

```
obtainDesign(
  grid = NULL,
  p0 = NA,
  p1 = NA,
  alpha = ifelse(is.null(grid), 0.05, NA),
  beta = ifelse(is.null(grid), 0.1, NA),
  fullGrid = FALSE,
  ...
)
```

### Arguments

grid	Optional. A tibble created by <code>createGrid</code> . If NULL, then <code>p0</code> , <code>p1</code> , <code>alpha</code> and <code>beta</code> must be specified and <code>createGrid</code> is called to generate the required grid. If not NULL then <code>p0</code> , <code>p1</code> , <code>alpha</code> and <code>beta</code> are ignored
p0	the response rate under the null hypothesis
p1	the response rate under the alternate hypothesis
alpha	the desired (one-sided) type 1 error rate
beta	the desired type 2 error rate
fullGrid	should the full grid of all possible designs be returned, or simply the optimal and minimax solutions? For a Mander and Thompson design, optimal and minimax designs are returned for both the null and alternate hypotheses. See Usage Notes below.
...	passed to <code>'createGrid'</code> or <code>'augmentGrid'</code> . In particular <code>mander=TRUE</code> for a Mander & Thompson design or <code>mander=FALSE</code> for a Simon's 2-stage design.

### Value

a tibble created by `createGrid`. If `fullGrid == FALSE` the table contains an additional column, `Criterion` indicating the type of design. Possible values for `Criterion` are "optimal" and "minimax" for Simon's designs and "optimalNull", "optimalAlt", "minimaxNull" and "minimaxAlt" for Mander & Thompson designs.

**Usage notes**

If grid is not NULL it is possible that none of the candidate designs are acceptable (that is, satisfy both the significance level and power requirements). If this is the case and fullGrid == FALSE, then an empty tibble is returned. If verbose == TRUE a warning message is also printed. If fullGrid == TRUE the full grid of all designs considered is returned. This can then be further interrogated to find optimal designs under constraints - for example with fixed stage sizes.

**Examples**

```
# Standard use (Simon's 2-stage design)
createGrid(p0 = 0.05, p1 = 0.25, alpha = 0.05, beta = 0.2, mander = FALSE) %>%
  augmentGrid(parallel = FALSE) %>%
  obtainDesign()
# Constrained stage sizes
createGrid(p0 = 0.25, p1 = 0.45, alpha = 0.05, beta = 0.2) %>%
  dplyr::filter(nStage1 == 8) %>%
  augmentGrid(parallel = FALSE) %>%
  obtainDesign()
```

---

powerPlot

*Plot the power curve(s) for the given design(s)*

---

**Description**

Plot the power curve(s) for the given design(s)

**Usage**

```
powerPlot(grid, probs = seq(0, 1, 0.01))
```

**Arguments**

grid	the tibble containing the designs to be plotted
probs	the response rates for which the rejection probabilities are to be plotted

**Value**

the ggplot object containing the power curve(s)

**Examples**

```
createGrid(p0 = 0.05, p1 = 0.25, alpha = 0.05, beta = 0.2, mander = FALSE) %>%
  augmentGrid(cores = 2) %>%
  obtainDesign() %>%
  powerPlot(probs = seq(0, 0.5, 0.025))
```

---

`searchBounds`*Obtain default bounds for the construction of the search grid.*

---

**Description**

The formula used is the continuity corrected Normal approximation from Fleiss et al (2003).

**Usage**

```
searchBounds(p0, p1, alpha = 0.05, beta = 0.2, twoSided = TRUE)
```

**Arguments**

<code>p0</code>	the response rate under the null hypothesis
<code>p1</code>	the response rate under the alternate hypothesis
<code>alpha</code>	the desired (one-sided) type 1 error rate
<code>beta</code>	the desired type 2 error rate
<code>twoSided</code>	two- or one-sided significance level?

**Value**

a list with three elements: "n" - the single stage sample size from Fleiss et al; "min" - the lower bound,  $0.8*n$ ; "max" - the upper bound,  $2*n$ . `floor()` and `ceiling()` are applied as appropriate.
