

Package ‘rIsing’

May 9, 2026

Type Package

Title High-Dimensional Ising Model Selection

Version 0.1.0

Description Fits an Ising model to a binary dataset using L1 regularized logistic regression and extended BIC. Also includes a fast lasso logistic regression function for high-dimensional problems. Uses the 'libLBFGS' optimization library by Naoaki Okazaki.

License GPL (>= 2)

Encoding UTF-8

LazyData true

Depends R (>= 3.1.0)

Imports Rcpp (>= 0.12.8), data.table (>= 1.9.6)

Suggests igraph, IsingSampler

LinkingTo Rcpp, RcppEigen (>= 0.3.2.9)

RoxygenNote 5.0.1

NeedsCompilation yes

--------------	----------

Description

Ising Model selection using L1-regularized logistic regression and extended BIC.

Usage

```
ising(X, gamma = 0.5, min_sd = 0, nlambda = 50,  
      lambda.min.ratio = 0.001, symmetrize = "mean")
```

Arguments

<code>X</code>	The design matrix.
<code>gamma</code>	(non-negative double) Parameter for the extended BIC (default 0.5). Higher gamma encourages sparsity. See references for more details.
<code>min_sd</code>	(non-negative double) Columns of <code>X</code> with standard deviation less than this value will be excluded from the graph.
<code>nlambda</code>	(positive integer) The number of parameters in the regularization path (default 50). A longer regularization path will likely yield more accurate results, but will take more time to run.
<code>lambda.min.ratio</code>	(non-negative double) The ratio $\min(\lambda) / \max(\lambda)$ (default $1e-3$).
<code>symmetrize</code>	The method used to symmetrize the output adjacency matrix. Must be one of "min", "max", "mean" (default), or FALSE. "min" and "max" correspond to the Wainwright min/max, respectively (see reference 1). "mean" corresponds to the coefficient-wise mean of the output adjacency matrix and its transpose. If FALSE, the output matrix is not symmetrized.

Value

A list containing the estimated adjacency matrix (`Theta`) and the optimal regularization parameter for each node (`lambda`), as selected by extended BIC.

Examples

```
## Not run:
# simulate a dataset using IsingSampler
library(IsingSampler)
n = 1e3
p = 10
Theta <- matrix(sample(c(-0.5,0,0.5), replace = TRUE, size = p*p), nrow = p, ncol = p)
Theta <- Theta + t(Theta) # adjacency matrix must be symmetric
diag(Theta) <- 0
X <- unname(as.matrix(IsingSampler(n, graph = Theta, thresholds = 0, method = "direct")))
m1 <- ising(X, symmetrize = "mean", gamma = 0.5, nlambda = 50)

# Visualize output using igraph
library(igraph)
ig <- graph_from_adjacency_matrix(m1$Theta, "undirected", weighted = TRUE, diag = FALSE)
plot.igraph(ig, vertex.color = "skyblue")

## End(Not run)
```

logreg

L1 Regularized Logistic Regression

Description

L1 Regularized logistic regression using OWL-QN L-BFGS-B optimization.

Usage

```
logreg(X, y, nlambda = 50, lambda.min.ratio = 0.001, lambda = NULL,
       scale = TRUE, type = 2)
```

Arguments

<code>X</code>	The design matrix.
<code>y</code>	Vector of binary observations of length equal to <code>nrow(X)</code> .
<code>nlambda</code>	(positive integer) The number of parameters in the regularization path (default 50).
<code>lambda.min.ratio</code>	(non-negative double) The ratio of <code>max(lambda) / min(lambda)</code> (default 1e-3).
<code>lambda</code>	A user-supplied vector of regularization parameters. Under the default option (NULL), the function computes a regularization path using the input data.
<code>scale</code>	(boolean) Whether to scale <code>X</code> before running the regression. The output parameters will always be rescaled. Use FALSE if <code>X</code> is already scaled.
<code>type</code>	(integer 1 or 2) Type 1 aggregates the input data based on repeated rows in <code>X</code> . Type 2 (default) uses the data as is, and is generally faster. Use Type 1 if the data contains several repeated rows.

Value

A list containing the matrix of fitted weights (`wmat`), the vector of regularization parameters, sorted in decreasing order (`lambda`), and the vector of log-likelihoods corresponding to `lambda` (`logliks`).

Examples

```
# simulate some linear regression data
n <- 1e3
p <- 100
X <- matrix(rnorm(n*p),n,p)
wt <- sample(seq(0,9),p+1,replace = TRUE) / 10
z <- cbind(1,X) %*% wt + rnorm(n)
probs <- 1 / (1 + exp(-z))
y <- sapply(probs, function(p) rbinom(1,1,p))

m1 <- logreg(X, y)
m2 <- logreg(X, y, nlambda = 100, lambda.min.ratio = 1e-4, type = 1)

## Not run:
# Performance comparison
library(glmnet)
library(microbenchmark)
nlambda = 50; lambda.min.ratio = 1e-3
microbenchmark(
  logreg_type1 = logreg(X, y, nlambda = nlambda,
                       lambda.min.ratio = lambda.min.ratio, type = 1),
  logreg_type2 = logreg(X, y, nlambda = nlambda,
                       lambda.min.ratio = lambda.min.ratio, type = 2),
  glmnet      = glmnet(X, y, family = "binomial",
                      nlambda = nlambda, lambda.min.ratio = lambda.min.ratio),
  times = 20L
)

## End(Not run)
```

rIsing

rIsing: High-Dimensional Ising Model Selection.

Description

Fits an Ising model to a binary dataset using L1-regularized logistic regression and BIC. Also includes a fast lasso logistic regression function for high-dimensional problems. Uses the 'libLBFGS' optimization library by Naoki Okazaki.

rIsing functions

- `logreg`: L1-regularized logistic regression using OWL-QN L-BFGS-B optimization.
- `Ising`: Ising Model selection using L1-regularized logistic regression and extended BIC.
