

Package ‘robStepSplitReg’

May 9, 2026

Type Package

Title Robust Stepwise Split Regularized Regression

Version 2.0.0

Date 2025-08-01

Maintainer Anthony Christidis <anthony.christidis@stat.ubc.ca>

Description Functions to perform robust stepwise split regularized regression. The approach first uses a robust stepwise algorithm to split the variables into the models of an ensemble. An adaptive robust regularized estimator is then applied to each subset of predictors in the models of an ensemble.

coef.robStepSplitReg *Coefficients for robStepSplitReg Object*

Description

coef.robStepSplitReg returns the coefficients for a robStepSplitReg object.

Usage

```
## S3 method for class 'robStepSplitReg'  
coef(object, group_index = NULL, ...)
```

Arguments

object	An object of class robStepSplitReg
group_index	Groups included in the ensemble. Default setting includes all the groups.
...	Additional arguments for compatibility.

Value

The coefficients for the robStepSplitReg object.

`predict.robStepSplitReg`*Predictions for robStepSplitReg Object*

Description

`predict.robStepSplitReg` returns the predictions for a `robStepSplitReg` object.

Usage

```
## S3 method for class 'robStepSplitReg'  
predict(object, newx, group_index = NULL, dynamic = FALSE, ...)
```

Arguments

<code>object</code>	An object of class <code>robStepSplitReg</code>
<code>newx</code>	New data for predictions.
<code>group_index</code>	Groups included in the ensemble. Default setting includes all the groups.
<code>dynamic</code>	Argument to determine whether dynamic predictions are used based on deviating cells. Default is <code>FALSE</code> .
<code>...</code>	Additional arguments for compatibility.

Value

The predictions for the `robStepSplitReg` object.

<code>robStepSplitReg</code>	<i>Robust Stepwise Split Regularized Regression</i>
------------------------------	---

Description

`robStepSplitReg` performs robust stepwise split regularized regression.

Usage

```

robStepSplitReg(
  x,
  y,
  n_models = 1,
  model_saturation = c("fixed", "p-value")[1],
  alpha = 0.05,
  model_size = NULL,
  robust = TRUE,
  compute_coef = FALSE,
  en_alpha = 1/4
)

```

Arguments

<code>x</code>	Design matrix.
<code>y</code>	Response vector.
<code>n_models</code>	Number of models into which the variables are split.
<code>model_saturation</code>	Criterion to determine if a model is saturated. Must be one of "fixed" (default) or "p-value".
<code>alpha</code>	P-value used to determine when the model is saturated
<code>model_size</code>	Size of the models in the ensemble.
<code>robust</code>	Argument to determine if robust measures of location, scale and correlation are used. Default is TRUE.
<code>compute_coef</code>	Argument to determine if coefficients are computed (via adaptive PENSE) for each model. Default is FALSE.
<code>en_alpha</code>	Elastic net mixing parameter for parameters shrinkage. Default is 1/4.

Value

An object of class `robStepSplitReg`.
