

# Package ‘usa’

May 14, 2026

**Title** Updated US State Facts and Figures

**Version** 1.0.0

**Description** Updated versions of the 1970s ``US State Facts and Figures'' objects from the 'datasets' package included with R. The new data is compiled from a number of sources, primarily from the United States Census Bureau or the relevant federal agency. Modern tidy tibbles provide richer state-level data including identifiers, geography, capitals, demographics, and socioeconomic statistics. Convenience vectors parallel the base 'datasets' state objects but extend coverage to all 51 jurisdictions: the 50 states and the District of Columbia.

---

city_names	<i>US ZIP Cities</i>
------------	----------------------

---

### Description

The United States Postal Service's official names for the cities in which ZIP codes are contained. This vector contains unique values, sorted alphabetically; because of this, they do not line up the other vectors in the way [zip\\_codes](#) and [zip\\_centers](#) do.

### Usage

```
city_names
```

### Format

A character vector of length 19108.

### Source

Daniel Coven's [web site](#) and the CivicSpace US ZIP Code Database written by Schuyler Erle [schuyler@geocoder.us](mailto:schuyler@geocoder.us), 5 August 2004.

---

counties	<i>US Counties</i>
----------	--------------------

---

**Description**

The county subdivisions of the US states and territories.

**Usage**

counties

**Format**

A tibble with 3,235 rows and 3 variables:

**fips** Five-digit FIPS code (state FIPS + county FIPS)

**name** County name (type suffix such as "County", "Parish", "Borough" removed)

**state** USPS state/territory abbreviation

**Source**

Census TIGER 2020 national county reference file, [https://www2.census.gov/geo/docs/reference/codes2020/national\\_county2020.txt](https://www2.census.gov/geo/docs/reference/codes2020/national_county2020.txt)

---

county_names	<i>US County Names</i>
--------------	------------------------

---

**Description**

The name of distinct US counties.

**Usage**

county\_names

**Format**

A character vector of length 1,925.

**Source**

Census TIGER 2020 national county reference file, [https://www2.census.gov/geo/docs/reference/codes2020/national\\_county2020.txt](https://www2.census.gov/geo/docs/reference/codes2020/national_county2020.txt)

---

people

*Synthetic Sample of US population*

---

### Description

A statistically representative synthetic sample of 20,000 Americans. Each record is a simulated survey respondent.

### Usage

people

### Format

A tibble with 20,000 rows and 40 variables:

**id** Sequential unique ID  
**fname** Random first name, see details  
**lname** Random last name, see details  
**gender** Gender (male/female)  
**age** Age capped at 85  
**race** Race and Ethnicity  
**edu** Educational attainment  
**div** Census regional division  
**married** Marital status  
**house\_size** Household size  
**children** Has children  
**us\_citizen** Is a US citizen  
**us\_born** Was born in the US  
**house\_income** Family income  
**emp\_status** Employment status  
**emp\_sector** Employment sector  
**hours\_work** Hours worked per week  
**hours\_vary** Hours vary week to week  
**mil** Has served in the military  
**house\_own** Home ownership  
**metro** Lives in metropolitan area  
**internet** Household has internet access  
**foodstamp** Receives food stamps  
**house\_moved** Moved in the last year

**pub\_contact** Contacted or visited a public official  
**boycott** Participated in a product boycott  
**hood\_group** Participated in a community association  
**hood\_talks** Talked with neighbors  
**hood\_trust** Trusts neighbors  
**tablet** Uses a tablet or e-reader  
**texting** Uses text messaging  
**social** Uses social media  
**volunteer** Volunteered  
**register** Is registered to vote  
**vote** Voted in the most recent midterm election  
**party** Political party  
**religion** Religious (evangelical) affiliation  
**ideology** Political ideology  
**govt** Follows government and public affairs  
**guns** Owns a gun

## Details

This dataset was originally produced by the Pew Research center for their paper entitled *For Weighting Online Opt-In Samples, What Matters Most?* The synthetic population dataset was created to serve as a reference for making online opt-in surveys more representative of the overall population.

See [Appendix B: Synthetic population dataset](#) for a more detailed description of the method for and rationale behind creating this dataset.

In short, the dataset was created to overcome the limitations of using large, federal benchmark survey datasets such as the American Community Survey (ACS) or Current Population Survey (CPS). These surveys often do not contain the exact questions asked in online-opt in surveys, keeping them from being used for proper adjustment.

This *synthetic* dataset was created by combining nine separate benchmark datasets. Each had a set of common demographic variables but many added unique variables such as gun ownership or voter registration. The surveys were combined, stratified, sampled, combined, and imputed to fill missing values from each. From this large dataset, the original 20,000 surveys from the ACS were kept to ensure accurate demographic distribution.

The names were randomly assigned to respondents to better simulate a synthetic sample of the population. First names were taken from the babynames dataset which contains the Social Security Administration's record of baby names from 1880 to 2017 along with gender and proportion. First names were proportionally randomly assigned by birth year and sex. Last names were taken from the Census Bureau, who provides the 162,254 most common last names in the 2010 Census, covering over 90% of the population. For a given surname, the proportion of that name belonging to members of each race and ethnicity is provided. The last names were proportionally randomly assigned by race.

---

state\_abbs

*US State Abbreviations*

---

**Description**

The 2-letter USPS abbreviations for the 50 states and District of Columbia. Parallel to [state\\_names](#).

**Usage**

state\_abbs

**Format**

A character vector of length 51.

**Source**

<https://www2.census.gov/geo/docs/reference/state.txt>

---

state\_areas

*US State Land Areas*

---

**Description**

Land area in square miles for the 50 states and District of Columbia. Parallel to [state\\_names](#).

**Usage**

state\_areas

**Format**

A numeric vector of length 51.

**Source**

TIGER/Web REST API (State\_County layer)

---

state_capitals	<i>US State Capitals</i>
----------------	--------------------------

---

**Description**

Capital cities for the 50 states and District of Columbia, with coordinates and 2020 Census population.

**Usage**

```
state_capitals
```

**Format**

A tibble with 51 rows and 5 variables:

**abb** 2-letter USPS abbreviation (join key)

**capital** Capital city name

**lat** Latitudinal coordinate of the capital

**long** Longitudinal coordinate of the capital

**population** Capital city population (2020 Decennial Census, city proper)

**Source**

<https://www.census.gov/quickfacts/>

---

state_centers	<i>US State Geographic Centers</i>
---------------	------------------------------------

---

**Description**

A list with components named `x` and `y` giving the approximate geographic centroid of each state in longitude and latitude. Parallel to [state\\_names](#).

**Usage**

```
state_centers
```

**Format**

A list of length two, each element a numeric vector of length 51.

**x** Centroid longitudinal coordinate

**y** Centroid latitudinal coordinate

**Source**

TIGER/Web REST API (State\_County layer)

---

state_convert	<i>Convert state identifiers</i>
---------------	----------------------------------

---

### Description

Take a vector of state identifiers and convert to a common format. Supports all five identifier types in [state\\_ids](#): USPS abbreviation, full name, FIPS code, AP style abbreviation, and ISO 3166-2 code.

### Usage

```
state_convert(x, to = c("abb", "name", "fips", "ap", "iso"))
```

### Arguments

x	A character vector of state identifiers in any supported format.
to	The format returned: "abb", "name", "fips", "ap", or "iso". Defaults to "abb".

### Value

A character vector of single format state identifiers.

### Examples

```
state_convert(c("AL", "Vermont", "06"))
state_convert(c("AL", "Vermont", "06"), to = "name")
state_convert(c("AL", "Vermont", "06"), to = "fips")
state_convert(c("AL", "Vermont", "06"), to = "ap")
state_convert(c("AL", "Vermont", "06"), to = "iso")
```

---

state_divisions	<i>US State Census Divisions</i>
-----------------	----------------------------------

---

### Description

The Census division to which each state belongs, one of nine. Parallel to [state\\_names](#).

### Usage

```
state_divisions
```

### Format

A factor vector of length 51.

**Details**

1. New England
2. Middle Atlantic
3. East North Central
4. West North Central
5. South Atlantic
6. East South Central
7. West South Central
8. Mountain
9. Pacific

**Source**

<https://www2.census.gov/programs-surveys/popest/geographies/2018/state-geocodes-v2018.xlsx>

---

state\_facts

*US State Facts*

---

**Description**

Updated version of the [datasets::state.x77](#) matrix, which provided eight statistics from the 1970s. This version is a modern tibble with updated statistics.

**Usage**

```
state_facts
```

**Format**

A tibble with 51 rows and 9 variables:

**name** Full state name

**population** Resident population (2020 Decennial Census, April 1, 2020)

**electors** Votes in the Electoral College (2020 Census reapportionment, applies 2022–2032)

**admission** The date on which the state was admitted to the union

**income** Per capita income in dollars (2022 ACS 1-year)

**life\_exp** Life expectancy at birth in years, both sexes (2021 NCHS)

**murder** Homicide rate per 100,000 population (2022 FBI NIBRS)

**college** Proportion of population 25+ with a bachelor's degree or higher (2022 ACS 1-year)

**frost** Mean number of days per year with minimum temperature below freezing (1991-2020 NCEI Climate Normals)

**Details**

See also [state\\_ids](#) for state identifiers and [state\\_geo](#) for geography.

**Source**

- Population: 2020 Decennial Census PL 94-171 file, variable P1\_001N via tidycensus
- Electoral College: 2020 Census reapportionment (NARA <https://www.archives.gov/electoral-college/allocation>)
- Income: 2022 ACS 1-year, variable B19301\_001 (per capita income) via tidycensus
- Life Expectancy: NCHS 2021 state life tables via <https://data.cdc.gov/api/views/it4f-frdc/rows.csv>
- Murder: FBI Crime Data Explorer API (2022 NIBRS)
- Education: 2022 ACS 1-year Subject Table S1501, variable S1501\_C02\_015 via tidycensus
- Frost: NCEI 1991-2020 Climate Normals, variable ANN-TMIN-AVGND5-LSTH032, <https://www.ncei.noaa.gov/data/normal5-annualseasonal/1991-2020/>

---

state\_geo

*US State Geography*

---

**Description**

Geographic and classificatory properties for the 50 states and District of Columbia. Keyed by `abb` to join with [state\\_ids](#).

**Usage**

state\_geo

**Format**

A tibble with 51 rows and 10 variables:

**abb** 2-letter USPS abbreviation (join key)

**region** Census Bureau region

**division** Census Bureau division

**area\_land** Land area in square miles

**area\_water** Water area in square miles

**lat** Centroid latitudinal coordinate

**long** Centroid longitudinal coordinate

**contiguous** TRUE for the 48 contiguous states and DC; FALSE for Alaska and Hawaii

**landlocked** TRUE for states with no coastline on an ocean, gulf, or Great Lake (21 states including DC)

**peak\_elev** Elevation of the state high point in feet

**Source**

- Regions and divisions: <https://www2.census.gov/programs-surveys/popest/geographies/2018/state-geocodes-v2018.xlsx>
- Area and centroids: TIGER/Web REST API (State\_County layer)
- Peak elevations: USGS state high point records

state\_ids

*US State Identifiers***Description**

The 50 states and District of Columbia — all naming and coding systems used to refer to each state. The backing data for `state_convert()`.

**Usage**

state\_ids

**Format**

A tibble with 51 rows and 6 variables:

**name** Full legal name

**abb** 2-letter USPS abbreviation

**fips** Federal Information Processing Standard Publication 5-2 code

**icp** IPUMS Integrated Census Project (STATEICP) code, zero-padded 2-digit string

**ap** AP style abbreviation; the 8 states with no AP abbreviation (Alaska, Hawaii, Idaho, Iowa, Maine, Ohio, Texas, Utah) use the full state name per AP style

**iso** ISO 3166-2 code (e.g. "US-AL")

**Details**

Naming convention: underscore objects (`state_ids`, `state_facts`, `state_geo`) are modern purpose-built tibbles. Convenience vectors (`state_abbs`, `state_names`, etc.) mirror the base R datasets `:state.*` vectors but cover all 51 rows (50 states + DC).

---

state_names	<i>US State Names</i>
-------------	-----------------------

---

**Description**

The full names for the 50 states and District of Columbia. Parallel to [state\\_abbs](#).

**Usage**

state\_names

**Format**

A character vector of length 51.

**Source**

<https://www2.census.gov/geo/docs/reference/state.txt>

---

state_regions	<i>US State Census Regions</i>
---------------	--------------------------------

---

**Description**

The Census region to which each state belongs, one of four. Parallel to [state\\_names](#).

**Usage**

state\_regions

**Format**

A factor vector of length 51.

**Details**

1. Northeast
2. Midwest
3. South
4. West

**Source**

<https://www2.census.gov/programs-surveys/popest/geographies/2018/state-geocodes-v2018.xlsx>

---

territory	<i>US Territories</i>
-----------	-----------------------

---

**Description**

The 6 US territories: Puerto Rico (PR) and the 5 island territories (AS, GU, MP, UM, VI).

**Usage**

territory

**Format**

A tibble with 6 rows and 6 variables:

**abb** 2-letter abbreviation

**name** Full legal name

**fips** Federal Information Processing Standard Publication 5-2 code

**area** Area in square miles

**lat** Center latitudinal coordinate

**long** Center longitudinal coordinate

---

territory_abbs	<i>US Territory Abbreviations</i>
----------------	-----------------------------------

---

**Description**

The 2-letter abbreviations for the US territories (PR, AS, GU, MP, UM, VI).

**Usage**

territory\_abbs

**Format**

A character vector of length 6.

**Source**

<https://www2.census.gov/geo/docs/reference/state.txt>

---

territory_areas	<i>US Territory Areas</i>
-----------------	---------------------------

---

**Description**

The area in square miles of the US territories (PR, AS, GU, MP, UM, VI).

**Usage**

territory\_areas

**Format**

A numeric vector of length 6.

**Source**

TIGER/Web REST API (State\_County layer)

---

territory_centers	<i>US Territory Geographic Centers</i>
-------------------	--

---

**Description**

A list with components named x and y giving the approximate geographic center of each territory in longitude and latitude.

**Usage**

territory\_centers

**Format**

A list of length two, each element a numeric vector of length 6.

**x** Center longitudinal coordinate

**y** Center latitudinal coordinate

**Source**

TIGER/Web REST API (State\_County layer)

---

territory_names	<i>US Territory Names</i>
-----------------	---------------------------

---

**Description**

The full names for the US territories (PR, AS, GU, MP, UM, VI).

**Usage**

```
territory_names
```

**Format**

A character vector of length 6.

**Source**

<https://www2.census.gov/geo/docs/reference/state.txt>

---

zipcodes	<i>US ZIP Code Locations</i>
----------	------------------------------

---

**Description**

This tibble contains city, state, latitude, and longitude for U.S. ZIP codes from the CivicSpace Database (August 2004) augmented by Daniel Coven's [web site](#) (updated on January 22, 2012). The data was originally contained in the `zipcode` CRAN package, which was archived on January 1, 2020.

**Usage**

```
zipcodes
```

**Format**

A tibble with 44,336 rows and 5 variables:

**zip** 5 digit ZIP code or military postal code (FPO/APO)

**city** USPS official city name

**state** USPS official state, territory abbreviation code

**lat** Decimal latitude

**long** Decimal longitude

**Source**

Daniel Coven's [web site](#) and the CivicSpace US ZIP Code Database written by Schuyler Erle [schuyler@geocoder.us](mailto:schuyler@geocoder.us), 5 August 2004.

---

zip_centers	<i>US ZIP Centers</i>
-------------	-----------------------

---

**Description**

A list with components named x and y giving the approximate geographic center of each ZIP code in longitude and latitude.

**Usage**

zip\_centers

**Format**

A list of length two, each element a numeric vector of length 44336.

x Center longitudinal coordinate

y Center latitudinal coordinate

**Source**

Daniel Coven's [web site](#) and the CivicSpace US ZIP Code Database written by Schuyler Erle [schuyler@geocoder.us](mailto:schuyler@geocoder.us), 5 August 2004.

---

zip_codes	<i>US ZIP Codes</i>
-----------	---------------------

---

**Description**

The United States Postal Service's 5-digit codes used to identify a particular postal delivery area.

**Usage**

zip\_codes

**Format**

A character vector of length 44336.

**Source**

Daniel Coven's [web site](#) and the CivicSpace US ZIP Code Database written by Schuyler Erle [schuyler@geocoder.us](mailto:schuyler@geocoder.us), 5 August 2004.
